Hi Tim,

If it's of any relevance, all the web pages you refer to are immediately loadable using Explorer on a Mac G3 and also with iCab.

Presto looks great, thanks to you and the good Dr Guerino Mazzola.

I use an Yamaha 4260 CDRW on my falcon. The newer 2100S on Mac.
4260 work perfectly with ExtenDOS for Audio, Data and BackUp on CD-R and
CDRW. 2100S not testet. Ask Roger Burrow (Anodyne) first.

Maybe. But Pascal sent me a multipart message the other day, composed
by the Mac version of OE, and one of the parts had a totally wrong
Content-Type. The result was, he couldn't extract the attachment.

>Hmm, there are a few problems left. For instance, Okami doesn't like
>Memory protection very much.

I wouldn't know what the problem is, Martin. There are no problems
under MagiC, and MagiC is very finicky with memory violations. I can't
test it, because I can't install FreeMiNT. Maybe you can ask someone
with FreeMiNT and a debugger (if it exists).

>'normal' ATARI C:\ boot partition.

Forget what I said. I was stupid, I never looked closely enough. I
don't need to do what you advised, because I just discovered you can
access any drive or folder on your PC from within MagiC-PC.

>Even if all the above is not possible, use the Pause! entry of the

>not loaded (copy from a folder to your MagiC_C drive). This way
>you'll not have to quit and restart MagiC and you'll not realize
>how slow your PC is :-)

I don't find my PC slow. But MagiC-PC is simply too unstable. In two
respects. It can't be trusted with all Atari programs. And it messes
up other Windows programs, so it's not safe to keep it running in the
background. In fact, most of the time I reboot when I have used MagiC.

>> Computers are supposed to be a help, not a
>> nuisance.
>>
>True, but window$ definitely are. Then why developing for them ?

I disagree that Windows should be a nuisance. It needs improving, but
we all do. And I don't develop for anything or anyone. I develop for
myself. A version of Okami that runs under Windows would be very
convenient for me, and maybe even for some others.

>Then, if the main reason is the one above, I hope now you can continue
>to support it more easily.

As I said, I don't really have that much time.

>> Maybe. But be realistisc. There are not more than a handful users now. :)
>
>Unfortunately this is not far from true. But many of us are determined
>to keep this platform alive.

I meant a handful of Okami users. And that will always remain a
handful, even if I port it to Windows.

>>
>>Thanks,
>>
>I have a little PRG (place to the AUTO folder)
>BOO_PRG.TOS for boot in a or b or c.

How dos this work? After all the computer will always try and boot
off A: if there is no hard drive. Do you mean that it first finds
the AUTO and your program on A:, then continues loading other
Auto-PRGs and ACCs from a separate AUTO and root directory on B:?

There was a simple hardware mod which I had done by Evesham to my
STFM which originally came with an SS drive: It consisted of
swapping over the connections to pins 19 and 20 on the YM-2149
sound chip. I had a DPDT change-over switch fitted so could boot
from either - handy if you don't have B: with you if you take the
machine elsewhere.

The mod was also described and illustrated in the old /ST World/
magazine in issue 35.

Regards, /Peter/

Hi John,

Have you tried best electronics for repair parts? they're good albeit more costly than used stuff. Unfortunately all my STe and newer are in use but I do have a mega 4 with tos 1.4 and a 520st with tos 2.5 and 2.5megs ram in working order.

Btw, what happened to that big newsletter you proposed at a TAF meeting a few months back? Only Aage and I have been working on anything for TAF after the june meeting and I haven't heard anything about that.

You could use a blitz cable with the software if you can find one (I have one of these finally) or there is also a program on one of the crawly crypt cd's (probly can be downloaded from that site) which can do many game disks too.

Here are a few things to check:

cables & termination (I know this is Uwe Seimets favorit thing to check first).
but since yoru old drive worked this might not be it.

try using a different hard disk driver program, like the HDdriver demo for
example. You sould also make sure that only the last drive in the chain is
terminated cause its easy to forget this when changing things around. Also
somethings to consider is parity enabled on any of the drives? not all host
adaptors for atari ST's get along with this feature. and make sure no scsi id's
are the same on more than one drive when trying several drives together.

Yes, there are scsi host adaptors that will work on this machine, you
could tryh a used adspeed (by icd) or micro adspeed (fits inside mega st)
or one of the newere link96 or link97. if you use those as keywords for
a search engine you'll likely find a site that has those for sale.

TT keyboard,
The printed mylar has a broker trace. I have tried a few different
things to bridge it. no luck. Any sugestions?

Part Two
About 8 or 9 years ago I bought a kit called MegaClick for my
megaST. I was able to do all but the Keypad. Best Electronics
have none. I installed 76 of them and still need 18. I think
There were two kits, 30 and 10 and at that time they were very
costly. Does anyone know were they might be found?

Part Three
Worse case, I had an MegaSTE and I think the keyboards were the
same, I have seen the price on used mega/TT keyboards. Anyone
have an extra to trade/sell ?

Thanks!
Mike

When 1.x was current, Calamus marketed their own font editor, appropriately called "Font Editor". With SL, and the subsequent change in how the font was rendered when the outlines crossed, it was replaced by Type Art. Type Art is still currently available, although I don't know if it's available in English. And of course Fonty is a font editor. My brain cells want to tell me there were one or two more, but consciously I'm drawing a blank.

If you only had read and followed the hints on my web site - on the
Troubleshooting page - you would have tried defragging earlier... ;)
You should defrag the disk before each recording session, to make everything
run as smoothly as possible. If you have a fragmented disk, you still have
the risk of clicks remaining after defragmentation, but there won't be any
clicks in the first place if the disk is defragmanted before the session.

> I assume that the clicks etc are due to CAF muting output whilst the disk

An AV-drive isn't necessary - there are normal drives which don't make
thermal calibration while operating.
During the years I used my Falcon for music, I never had an AV-drive - and I
worked around the clock with the system now and then...

> Don't use Diamond Edge on LFN partitions.

CAF doesn't support anything but normal TOS-partitions, so I don't believe
there's much risk there... ;)

Which version of which works with which? I got the latest Pacifist and
couldn't get it to work. I was also using TOS 2.06... And, AFAIK, there
is only 1 version of STOS.

If you know of a combination where the STOS mouse works, please tell me!
It would help me a heck of a lot!

>Yes, there are scsi host adaptors that will work on this machine, you
>could tryh a used adspeed (by icd) or micro adspeed (fits inside mega st)
>or one of the newere link96 or link97.

Correction. You should look for an ICD MicroAdSCSI host adapter. This will plug easily into the internal DMA port in the MegaST. Trying to find these is a pain though.

Also don't buy anything from ICD directly from their web site.

Good luck.

3191. Twilight screensaver

Newsgroup: comp.sys.atari.st

Hi all!

Does anyone know where I can get the full version of the Twilight
screensaver?

Best would be an English version, but if not the German would suffice.

It's not for me (I use Turboblanker), but for a buddy.

Cheers!

James

3192. VISION 4.0e

Newsgroup: comp.sys.atari.st
Date: 2001-09-01 08:30:06 UTC
From: Jean Lusetti <jlusetti@free.fr>
Message-ID: <i01k7.1356$SN6.1450039@nnrp4.proxad.net>
Source record: 42262

Hi !

A little message to inform you that VISION 4.0e is out with :

Many bugs fixed :-)
New version of JPEG (DSP) decoder from Brainstorm thanks to Carsten Pauer.
This version is much better for CT2 users.
VISION is available in Italian thanks to Lodovico Zanier
New LDV : Perspective Y
Scale functions ("Change size...", full page, image browser...) are faster
from 2 to 3 times !
Real time zoom speed is increased by 10% to 40% !
Zoom on an image is up to 5 times faster !
All these scale/zoom relative functions are also memory optimized as hey
require *much* less memory to run.
Some totally invisible stuff added in order to prepare for the future
external image modules.
The bit-planes to TOS indexes function (RaRaster2Ind) is 3 to 4 times faster
! I was thinking of optimizing it for long away...
New functions RaTC15RemapColors, RaTC16RemapColors, RaTC32RemapColors,
RaRasterRotateGetDstMFDB, RaRasterRotate, CoGetFunctionOptimizations in VAPI
Rotation, gamma correction and brighness have been moved into LDV
You can edit the LDV parameters values by typing in the current displayed
value
A LDV can change the parameters sent by VISION (may be useful if you want
your LDV to set all parameters to the same value)
VISION can manage the selection, so the LDV has to deal only with a "full"
image (see LDVF_NOSELECTION)
In the "LDV Apply" dialog, we can change the size of the preview and even
hide the source preview in order to increase the size of the destination
preview, here are the keys of interest in the LDV section of VISION.INI :
PreviewDstSize and PreviewSrcSize
If PreviewSrcSize is set to 0, only the destination preview will be
displayed
Some memory optimzations : a lot of static data has been moved to dynamic
allocations like windows, Undo buffers (you can now have 99 Undo buffer PER
image!), etc... Even with the new features VISION saves up some 28 KB of
memory !
MeSCopyMemory8, MeSCopyMemory16 , MeSCopyMemory32 functions are 40% to 300%
faster !

All this stuff on http://vision.atari.org download page :
http://www.multimania.com/jlusetti/telee.htm

See you, Jean
http://vision.atari.org

Hello,
Sorry it took so long for me to follow-up.

I have been studying my mixer manual.
It has some interesting features.
I could plug two low impedance mics in the board.
There is an Aux In jack and a Channel Patching jack in.
It is possible to plug a 1/4 inch jack half-way into Channel Patching
jack. Each channel has this feature.
So now I would be by-passing all the eq on the board and would then
be able to plug into say a tape deck. (Or in my case, the Falcon)
Is this what you mean by a mike level output?
Except now I only have 2 mics. If I use y-chords, 4 would work.
And no eq off of the board.

thanks
ken

> than necessary that way. It's much better to modify the circuitry in the
> computer.

Hello Claes,
Thanks for the tip.
Sorry it took me so long to respond.

I think I should be able to connect line level outputs on mixer to
mic input on Falcon.
I am sorry that I am rather new at this, but I don't understand
why all these internal modifications on the Falcon have to be made.
Why can't you just eq off the board? What is the problem with the Falcon?

Ok, so lets say I get the signal in. Hypothecially at this point.
After recording the tracks with Logic Audio, would I then be able
to burn them to a CD directly from the computer?
I would use ExtenDOS software.

I'd like to see if I can find out what the problem is with Logic
Audio, before moving to another program like Cubase.

thanks
ken

Have you cleaned each side of the break thoroughly and tried bridging by soldering a fine copper wire across?

> > Worse case, I had an MegaSTE and I think the keyboards were the
> > same, I have seen the price on used mega/TT keyboards. Anyone
> > have an extra to trade/sell ?

IIRC, they should. It seems I remember seeing a Mega STE keyboard attached to a TT at my Atari dealer, and I've used my Mega keyboard on my TT, so you would think... <G>

>pricey at the time IIRC, but someone may have it spare.

There's Fonty, but AFAICS this can only load characters for
modification that are in the font to start with. Of course, there
is nothing stopping you converting another, unused, character to
'@' but you would have to use that character on the keyboard to
input it (or do it manually in Calamus).

Or did you mean something else?

3202. Jobs: ESNA

Newsgroup: comp.sys.atari.st
Date: 2001-09-01 21:25:08 UTC
From: Bengy <bengy@mac.com>
Message-ID: <B7B6AE54.2ACD%bengy@mac.com>
Source record: 42272

Europe Shareware North America (http://www.europe-shareware.org/english) is looking for dedicated team members to join its volunteer staff. Currently, the following positions need to be filled:

Product Recruiter: ESNA is a multi-platform distributor - that is, they help programmers of the Macintosh and Java platforms, as well as their Atari backbone. Your job, if accepted, would be to find new applications that ESNA would distribute. In order to do this, you must have good communication skills (You have to convince the authors why ESNA is beneficial to them) and must not be shy to talk with skilled and important individuals.

Advertising Officer: The public needs to be informed about new ESNA software and press releases, and if you are chosen for this position, it would be your job to keep them informed. This is accomplished through news group and e-mail postings, contact with news organizations (print and digital) and strategic use of advertisement material. Advertising material (magazine ads, web banners etc.) would be created by this position, thus making communication and graphic creation skills essential to this position.

Benefits: ESNA, like its counterparts in France, Spain, and Belgium, is a non-profit organization, and thus no positions are currently paid. So what are the benefits to helping ESNA?

-Establish a name for yourself
-Gain valuable experience - looks great on a resume!
-Truly help the computer industry and the platform(s) that you love - you will make a difference.
-Access to internal mailings, which often include confidential and inside information. Won't that make you feel important?
-All staff members of ESNA will receive an ESNA T-Shirt. That's better than money!
-You meet smart, prominent people in the computer community, and have a great time doing it.
-ESNA has a commitment to making itself publicly known - and one of the ways of doing that is attending Computer Fairs and Trade Shows. Team members are welcome to come to such shows, meet the rest of the team, and make a presence in the ESNA booth.

Think you can handle it? E-Mail support@magical-sides.de to apply. The application e-mail should indicate why you think you could handle the job, and why you want the position. If you have a Resume made up, feel free to send it along - but it's not required.

(This message has been posted to Macintosh, Atari, and Java news groups)
Contact: support@magical-sides.de
ESNA: http://www.europe-shareware.org/english/

Yes I agree with that too!

I just partitioned a 20Gb IDE drive, with I to O being "F32" ready for
using with MagiC 6.01 as VFAT partitions! It seems Magic doesn't want to
recognise that they exist! It displays them on the desktop but any
information is limited to ?????bytes etc. They are just under 2Gb each.

Is there another English version of MagiC out there?

Cheers

Neil :-)

Hi Piotr

I have a Yamaha CRW2100S with my Falcon CT2B it works perfectly well with
it. Upto 4 times writing and very fast reading, better than my old NEC
52x CDROM drive!

Yamaha or Plextor seem to be the makes to go for.

Neil

Hi Ken!

Not unless the patching is done right at the input, before any
amplification (other than possibly buffering). Hard to say without
the circuit, but usually patching is done at line level, or in any
case after amplification of mike inputs. In any case, you don't
want to lose the EQ. Tape decks would normally expect something
approaching line level, say 300 mV or so, while the unmodified
Falcon takes something like 1 mV or less (though I am not sure).

****
From the Chip&Chips X HYP
(Source: Pages 21, 31 and 33 of Falcon030 Hardware Documentation)

Stereo Microphone Jack

The effective impedance of the microphone port is:
2.15 K Ohm, 0 Hz - 30 Hz
1.77 K Ohm, 30 Hz - 900 KHz
0.00 Ohm, >900 KHz

IMPORTANT: A 200K Ohm resistor should be used in series on each microphone input when connected to a 1V RMS "Line" level signal (such as the Line Out signals from a CD Player)

****
Your best bet is to have the Falcon modified for line input as ddescribed below, or if you can't do that use the 200 KOhm series resistor in each live feed as an attenuator as suggested originally.

An earlier version of Chips&Chips says that there is also 8V d.c. on the input for phantom powering mikes (possibly this was only on early Falcons). They suggest the following to (mostly) overcome this and also reduce the level from line to mic:

```
Stereo amp OUT >----\/\/\/--+--------> Falcon sound in
ca.80K |
\
/ 1K
\
/
|
---
```

They also give details of the mods to the Falcon:

`Line Level' input to the mike socket on the Falcon030

The following alterations have to be made:

Remove components: R56, R47, R90, R92 as well as C21 and C81

Alter existing components:

Change R66 from 100 KOhm to 15 KOhm
R87 from 100 KOhm to 15 KOhm
C129 from 0.01 uF to 330 pf +/-5%
C124 from 0.01 uF to 330 pf +/-5%

The following additional components have to be added:

Capacitor 470 pf NPO, parallel to R67
Capacitor 470 pf NPO, parallel to R88
Capacitor 330 pf NPO, parallel to R66
Capacitor 330 pf NPO, parallel to R87

Resistor 100 Ohm in series with output Pin 4 of the LM387 (Chip U9)
Resistor 100 Ohm in series with output Pin 5 of the LM387 (Chip U9)
Attention: Both pins have to be lifted off the board!
****

Hope that helps!

Regards, /Peter/

The problem is that the developers thought of the Falcon mainly as a games
or multimedia machine, which should mave most need for microphone level in
and loudspeaker out, with a bass boost on the output to make the sound more
impressive :(
This is completely wrong for musicians, since we always need line levels in
and out to connect to other equipment - and we want to make our own
decisions whether or not to boost the bass...
You should not connect a line level output to a microphone input, since the
level is WAY to hot and will get distorted. Of course, you can turn the
output of the mixer down close to zero (which will make the background noise
in the mixer more noticable), or put a damping circuit between the line out
and the falcon's mic in, and get it sort of working - but then you introduce
other problems, which are spelled N-O-I-S-E. Noise isn't what you want to
burn on CD's - you want music instead. The reason why you'll get more noise,
is because you send a very low level out from the mixer, which will give you
more disturbance from other sources into the cable. You might have a low
enough level not to distort the input stage of the Falcon - but since it's a
microphone input, the incoming signal will be VERY much amplified - along
with the same amplification of the noise which has been picked up along the
way - and you won't have a very nice sounding result.

I would absolutely recommend that you have all those modifications made if you're going to use the Falcon as a music machine.

> Ok, so lets say I get the signal in. Hypothecially at this point.
> After recording the tracks with Logic Audio, would I then be able
> to burn them to a CD directly from the computer?
> I would use ExtenDOS software.

Yep, you would. However, you'll have to make a stereo mix by going out from the outputs and into the inputs, choosing tracks wisely not to get feedback. With a stereo file of 44.1kHz and 16-bit, you'll be able to burn a normal Audio-CD. I'd recommend CDRecorder from SoundPool as your burning software, since you can make full adjustments of PQ data in the audio program.

> I'd like to see if I can find out what the problem is with Logic
> Audio, before moving to another program like Cubase.

I know several people who got tired of problems with Logic Audio locking up or that it wasn't able to use more than maybe 4 audio tracks at a time and other things. They all changed to Cubase Audio eventually, but it's your time that's being wasted - so it's your choise...

I'm not sure whether you need a newer version of MagiC, but if I
remember correctly 6.1 is required for FAT32. The current version is
6.2.

Yep, I think you are indeed correct. The English release supplied by
Atari Workshop is still only version 6.01 (confusing numbers eh?).
Is 6.2 available as I thought this was in a thinking stage?

Neil, if you have the registered English release of MAgic with the manual
then there is little that would of changed I think and you can still use
your English version of Magxdesk, Thing, Jinnee or whatever desktop you
use. I'm just wondering where I can get my version of magic updated.

>Is there another English version of MagiC out there?

No.

Download the English resource file for MagxDesk from the DDP section of my web site, or use Thing or jinnee instead. Apply the patches to magic.ram that have already been published in here or nearby to get the right language cookie returned.

OK, sure is the floppy drive from what you say. I'd get a PC drive, or if your not that bothered you could put a DD drive in but then you may find that'll go after a few months as they are getting rather old :)

Anyway, you'll need to switch the drive to ID 0 or DS 0 via a jumper or usually a solder pad. If it doesn't have this then you need to cut a track inside the floppy unit and solder a jumper wire, contact me if you need to do this.

Next you might need to make a modification to the way the drive senses disk changes, there is info on Hallvards site for this. Otherwise you may corrupt disks!

You may also need to make a modification to the drive to make your HD module detect HD or DD disk. It depends which module you have, I presume TUS right?

Also, I've found that modern PC floppy drives just can't cut it for these oddly formatted disks, eg 80+ tracks and 11 odd sectors. My Falcon has a PC floppy drive and if I want to install Positive Image or Lattice C disk 6 then I have to get out my old Falcon floppy drive. Damn annoying, this occurs on two out of two PC floppy drives I checked with.

Source record: 42288

Atarians,past and present your help please.

Some years ago my STFM was upgraded to 4Meg,internal HD & DD floppy (with connection for additional external drive),switchable TOS 1.00/2,06.Later a CD Rom,external HD/DD floppy and Hard Disk was added. Recently the internal floppy has been playing up. The problem is:

Double clicking on the internal drive will open up the disk to show its contents.Double clicking on a folder will open it up.Then the problem starts. Trying to start a .PRG brings up the info that the disk is faulty. .DOC.TXT files etc can be opened and read. This is the same whether the disk is HD or DD. There is no problem using the external drive with the same disk. The warning also appears if the disk has Auto start.

Your ideas would be appreciated. Zetnet-Atarians have kindly supplied some help such as attempting to clean the drive etc.If I decide to change the drive would a PC one fit without the usual mods as the fitted unit is DD/HD?

Thanks for your time

Derek

Source record: 42292

Hi,

I bought a Steinberg Atari Midi-3 some years ago, but I just started using it now (bigger Atari). The problem is that I added the drivers on the right location as said in the manual, but I still only have the options "MROS" and "ATARI" in OUTPUT, no "STMI3 1", "SMTI3 2" and "SMTI3 3" as there should be...

some more info:
I use Cubase Score for Atari, v2.0, on an Atari TT030 (installed on harddisk, not from floppy)

I hope my newsserver gets the replies, because it's often incomplete :(
You can also contact me on my site (forum, mail, MSN, ICQ)

Have you tried a PC 3.5" drive? I remember, a very long time ago,
replacing a faulty 720K in an STe and was surprised and relieved it worked
OK :) .. I did have to modify the case ever so slightly for the eject
button and set the drive to device 0.

Directly quoted from an FAQ :

3.3 Floppy Drives?

3.3.1 Replacing a floppy drive

The disk drives used by Atari ST computers are industry standard 360K or
720K double-density floppy drives, exactly the same as those in PCs... at
least in those days.

PC drives can be used as replacement drives, only nowadays it is difficult
to find 720K drives. You can however use just about any 1.44Mb HD drive as
these will perform perfectly well in DD 720K mode.

Nevertheless, you have to be aware of the following :

You need to be able to change the ID number of the drive to 0 instead of
the default 1 for PCs. Usually there is a jumper to do this, but it tends
to disappear on modern drives, making this rather tricky. It now often
involves connecting a solderpad on the drive's PCB. You need to connect
the cable upside down on the drive. This can mean cutting a little plastic
part that is designed to make this impossible. You need to set the Media
Change Detect jumper, or else, under certain circumstances, your disks
might end up scrambled. This jumper no longer exists on most modern
drives, but you can work around the problem by using the Force Media
Change program.

Most modern HD drives can no longer read single sided 360K disks.

Hallvard Tangeraas' instructions on how to use a Sony drive in an Atari.

Hmmm, having a C-Lab Falcon, I appear to have the opposite problem in
that since I have line level input, I can't just plug in a microphone
and get going. Hence a pair of questions:

1) Is the microphone to Falcon setup a matter of buying a preamp to
go in between them, or is it more complicated?

2) With line level input, is there a danger to the Falcon when
connecting the output from a headphone jack? (I know the volume
should be turned way down on the sending device).

Then again, it might be. When changing drives, cables that have not
been moved for years are flexed and physically moved. In certain
cases, this can cause problems. This rather looks like a cabling or
termination problem. What software driver are you using to access the
drive?

Since you have a line-level input, just use a normal microphone preamp as
you suggest - and then it's rock'n'roll... :)

> 2) With line level input, is there a danger to the Falcon when
> connecting the output from a headphone jack? (I know the volume
> should be turned way down on the sending device).

There's probably no immediate danger for the Falcon - other than for a
distorted signal. However, the headphone output is designed to drive
loudspeakers, so there's a power amp (small, but yet...). A power amp's
output can be damaged if it's loaded with too low impedances and I don't
remember the impedance of the Falcon's input... I wouldn't recommend you to
do this. Don't you have a line level output to use instead of the headphone
output?

Jaguar Corner at the Ohio Atari Swap Meet

September 1, 2001

Columbus, Ohio - Come join us for fun and games at the Atari Computer Enthusiasts of Columbus
annual Atari Swap Meet to be held on September 8, 2001. This annual event boasts a wide
selection of Atari games and systems for sale. Last year the event had many items available
for the Atari ST, 8 Bit computers, 5200, 7800, and 2600.

This year, the Jaguar Corner will be at the Swap Meet. The Jaguar Corner is your chance
to play the most popular and rare games available for the Atari Jaguar video game console.

Featured games available for view and play are:

- New games from Songbird Productions (http://songbird.atari.net/) including Skyhammer,
Protector, Hyper Force, and Soccer Kid for the Jaguar; and Lexis, Championship Rally,
PONX, Remnant, and more for the Lynx.

- Doom and Air Cars in 2 Player, 2 Console Network Play

- BattleSphere from Scatologic (www.scatologic.com) available for play and demo

- Jaguar CD with games such as Primal Rage, Vid Grid, Blue Lightning, Battlemorph, and
World Tour Racing

- Popular Jaguar games such as Towers II, Worms, Zero 5, Defender 2000, Atari Karts, and
Breakout 2000

- JUGS (www.buyjugs.com - The Jaguar Underground Game Server) which allows the downloading
of underground, homebrew games into the Jaguar. Underground games available for play
include Asteroids, Gorf demo, Jagmania, Jag Tetris, and Native.

The Jaguar corner is being promoted by Fred Horvat (fmh@netzero.net) and Brian Gentile (mail@addie.cjb.net) of Addie's Atari Page (www.addie.cjb.net).

The Atari Swap Meet is being run and promoted by the Atari Computer Enthusiasts of
Columbus (http://www.angelfire.com/oh4/acec/acec.html).

The Atari Swap Meet and the Jaguar Corner will be held from 9:00 am to 3:00 pm on
September 8, 2001 at:

Oakland Park Community Building
980 Lenore St.
Columbus, Ohio 43224-3351

Directions: From I-71, take the E. North Broadway Street exit east, turn left onto
Maize Road, and a quick right on Lenore Avenue.
Admission: The price of admission to the Atari Swap Meet is $4 per person and $6 per vendor
table (includes one admission). The Jaguar Corner costs nothing!

For the latest details on the Jaguar Corner, see Addie's Atari Page
(www.addie.cjb.net).

3236. Atari TT - TT RAM card problem...

Newsgroup: comp.sys.atari.st
Date: 2001-09-03 14:05:06 UTC
From: MrSiwy <psion5@kk.net.pl>
Message-ID: <9n02lqqrd1@news.tpi.pl>
Source record: 42207

Yes I finally get-it - the CA401058-xxx expansion card for my Atari TT :-)
But there is one problem - it's not working :-(

I connected this card to the TT RAM connector on the TT main board.
I properly inserted the 4x1MB 30 pin sim's (8 chips on each sim) which I
remove from MEGA STE.
I change the switch position to use 4x1MB with NO BURST mode (6 switches
from W101 to W106)

....
and nothing happens.........

Should I also change some switches or DIP's on Atari TT main board ???
There are one block of DIP switches from 1 to 8 called J203
There are also 3 switches W601, W602, W603 close to main RAM
And also one switch close to main CPU called W101

Can anybody help me with this.

best regards
Slawek

That would certainly make sense. I never thought about it before
because I always started with a fresh/empty partition when recording
with CAF. But it quickly becomes fragmented due to the way CAF
records to the drive.

>BTW, I know next to nothing about recording audio on our platform, but I'd
>probably want to make sure that I was using an AV-rated drive. These don't
>recalibrate themselves whilst you're recording.

I've got a 7200 RPM Seagate Barracuda drive that does not do the
recalibration while being used.

>Don't use Diamond Edge on LFN partitions.

Oh yes, I'm aware of that. Since I use MagiC on my Falcon most of the
time (except when running CAF or a couple other MIDI/audio related
apps), I've got a few empty partitions set aside for CAF without long
file names enabled.

Although, in my experience, Diamnod Edge will work ok on LFN
partitions, as long as there aren't actually any files with LONG
names. In other words, I've recorded audio to a partition with LONG
NAMES support _enabled_, but did it under TOS, using the standard 8+3
filename format, and was able to defragment the partition with Diamond
Edge without any trouble.

>clicks in the first place if the disk is defragmanted before the session.

Actually Claes, I have read your pages many times, and find them most
helpful! ;-)

My reason for NOT suspecting fragmentation as the cause of the clicks
and pops was because I __always__ start any session recording to a
completely EMPTY partition that is set aside specifically for audio.
There is nothing else on that partition at all - except for whatever
I'm recording in CAF.

And in the past, I would always do a defrag _after_ the recording
session was finished, but I never thought to try it mid-session, when
a noise would show up, until Wayne martz suggested that to me. As I
mentioned before, whenever I would get a pop or click, I'd simply
re-record the track.

So, after doing some testing, I noticed that it seems to take about 6
or 7 recorded tracks before the first noise will show up. And,
obviously at this point, fragmentation has begun - which is easily
seen under Diamond Edge.

>An AV-drive isn't necessary - there are normal drives which don't make
>thermal calibration while operating.
>During the years I used my Falcon for music, I never had an AV-drive - and I
>worked around the clock with the system now and then...

My drive is a 7200RPM Seagate Barracuda. It doesn't do the thermal
recalibration, but to the best of my knowledge, _isn't _ classified as
an "AV-drive", so I tend to agree with you here.

>CAF doesn't support anything but normal TOS-partitions, so I don't believe
>there's much risk there... ;)

Well, I have a few empty partitons, that have long file name support
enabled when used under MagiC 5. And I can safely record to these
partitions under TOS (with CAF). TOS sees them as normal partitions.
And as long as I don't actually use any LFNs, Diamond Edge can handle
them without any trouble too.

If you want to bypass all the Falcon audio modifications, as well as
get a much cleaner and better sound, I would suggest picking up a
Falcon Digital Interface (FDI). This device connects to the Falcon's
DSP port, and gives you digital IN and OUT (via coaxial or optical
connections). This way, you don't have to bother with the Falcon's
built-in inputs/outputs.

You will, of course, need a device such as a DAT machine, so you can
use it's converters (A/D to send to the FDI input, and D/A to receive
the signal from the FDI output). In other words, you record _through_
the DAT, which sends the digital signal to the FDI and into the
Falcon.

You can also get an external, multiple output expander (with it's own
D/A converters) to connect to the FDI output.

Check out the SoundPool web site for more informnation:

I have experienced very similar symptoms when power supply to floppy
was not within tolerance. Contact resistance on power supply connectors
may have increased because of age and oxydation so even if the computer's
power supply gives correct voltages they do not reach the floppy, or
even the motherboard.

So, use a digital voltmeter and check if voltage delivered to floppy
drive is 5V +/-0.1 V (theoretically, tolerance could be +/-0.25V but it
would be good to be on the safe side). Check 12V too (tolerance for this
is not so strict). Also, check if the computer motherboard gets 5V +/-0.1 V.

Eventually, it may turn out that the drive is faulty- maybe the head has
become misaligned, or it is not stepping proprerly. From what you say, it
seems that the first track is read correctly (i.e you get the directory)
but then the drive does not get to the correct track to read the file
itself (it may be accidental that you can read some files anyway,
depending on where they are located).

Oh, and what about your DD/HD switching circuit? Are you sure there is not
any fault there? Also, is the step-rate set correctly?

cu.

>occurs on two out of two PC floppy drives I checked with.

When I installed a HD drive I found out that it could not read properly
disks which were formatted with 84 tracks. Upon inspection it turned
out that there were mechanical stops in the drive which limited head travel.
Careful shaving of these stops for a fraction of a millimetre with a scalpel
cured this problem (there is a little utility program out there which can
be used to check how many tracks a drive can handle).

3245. STiNG problem?

Newsgroup: comp.sys.atari.st
Date: 2001-09-03 21:04:36 UTC
From: vdjole@EUnet.yu
Message-ID: <9n0r91dkp3@news.eunet.yu>
Source record: 42216

Hi;

Some time ago I noticed a problem which seems to appear more and more
often now, when I download a large file from the net (using Sting or Stik,
it doesn't matter). It goes like this: if average transfer speed drops
significantly from theoretical, download sometimes stops prematurely,
without any error messages, although only part of the file has been
transfered. This seems to happen with some sites more often than with others.
It happenes in the same way when using CAB and Newsie. For example, I use a
14400 modem and usually get transfer speeds of about 1600-1700cps. I had a
case where a file transfer invariably stopped prematurely after a while if
average transfer speed was about 1300cps or lower. I mention that it is not
the question of timeout values set in CAB (or Newsie), because a transfer
just stops in the middle of a receiving, i.e. it does not timeout.

Is there something I can do in configuring Sting in order to prevent this,
or is the problem "on the otther end"? I almost have a feeling that
there is some timer on the ftp server or on my ISP's machines which
estimates how much time it should take to transfer a file and aborts
a transfer if this time is exceeded.

Thanx in advance.

cu.

3246. Re: Audio question - mixer to Falcon

Newsgroup: comp.sys.atari.st
Date: 2001-09-03 22:05:02 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3b93ff85$0$15661$272ea4a1@news.execpc.com>
Source record: 42217

Hello,
Thank you for your suggestions. I am still contemplating what I will do.

> >I think I should be able to connect line level outputs on mixer to
> >mic input on Falcon.

Right now, I am just trying a basic test. Which isn't working very well.

I found an attenuator that I guy made for me many years ago.
Line outs of mixer -> attenuator -> Falcon mic input.

I booted Logic Audio, used the outputs of a cassette deck just
for a test. It looked as if it were recording, (The transport window
was clocking) but I couldn't see any levels on the meter.

Do you have to have additional Direct to Disk hardware in order
to use Logic Audio?

thanks

ken

3247. Re: 520STFM Drive B: switch

Newsgroup: comp.sys.atari.st

>>swapping over the connections to pins 19 and 20 on the YM-2149
>>sound chip. I had a DPDT change-over switch fitted so could boot
>>from either - handy if you don't have B: with you if you take the
>>machine elsewhere.
>
>Yep... thats what I was after...
>
>>The mod was also described and illustrated in the old /ST World/
>>magazine in issue 35.
>
>Anyone have a scan of this!?

No sorry, but it's very simple: Cut or unsolder the legs of pin 19 and 20 on the Yamaha (or cut their traces, but that makes soldering more difficult) and connect four (differently coloured for preference) wires, two to the cut legs and two to the board where they used to go (if you cut correctly, the old stubs can be soldered to sometimes, and you don't need to remove the PCB). Then connect a small DPTD change-over switch to the four wires, with those from the chip going to the centre contacts and the other twop cross-connected diagonally and going to the board, so in one position the original connections are restored and in the other they are crossed over.

Rather crudely in ASCII art:

```
Pin 19
|
|
o****o /o-------Trace ex 20
\ /----/
/
/ \_____
o****o \o-------Trace ex 19
|
|
Pin 20
```

When the switch (****) is in the position shown, the original connctions will be restored and the internal drive will be A: and the external B: while if you slide it to the right tey willbe

swapped over. It doesn't matter whether you use a toggle switch
(which is easy to mount in a small hole drilled through the case
near the chip) or a sliding switch (much harder to find room for!)

Regards, /Peter/

>--

It's damn annoying these drives work to their design specs, but not
beyond the design limits?

80 tracks is the way 3.5 inch drives were designed. If a particular
drive is out of spec enough to allow you to squeeze another 2 or 3
tracks, then it's a "bonus", but hardly to be expected.

And if they're built to rigid specs and tolerances and won't go beyond
their design limits, that's something annoying?

The fact that Atari used sloppy drives in their products doesn't sound
to me like a very good thing.

Sure, I pushed the tracks and sectors on my Atari drives, but never
with the expectations that they would do it. And never for anything
important, or that I wanted to exchange with anyone else.

Sounds to me like the manufacturers of PC drives are doing a lot
better job than the ones Atari bought for the lowest bid.

Of course fragmention will only occur if you've deleted some files before
writing some more or are somehow recording several files simultaneously.

3253. MfD III MintNet

Newsgroup: comp.sys.atari.st
Date: 2001-09-04 10:51:20 UTC
From: nospam@zonnet.nl
Message-ID: <lm2l7.90308$Vs4.443599@zonnet-reader-1>
Source record: 42224

Everything that could go wrong did go wrong, but now I have finally installed MiNTNet on my Falcon based on the Mintnet for Dummies distribution MfD III.

Question. When I enter "pppd call zonnet" (zonnet is the file I use in my /etc/ppp/peers folder) in the bash, I first get these message

/pipe/log: No such file or directory
/pipe/log: No such file or directory
bash-2.03#

And then suddenly pppd starts to dial, giving me a succesful connection. Can anyone tell me what is happening here?

3254. Printer drivers

I have a large selection of classic computer and video game hardware, software and accessories for sale, many from private collections. Many of the items and game titles (for Intellivision, Colecovision and Atari) are still available in shrink-wrapped/brand new form, ideal for anyone just starting a classic computer or videogame collection.

Currently I have items for the following models/systems...please email me with the categories you are interested in, to receive a detailed listing.

- Atari 8bit Computers
- Atari ST Computers
- TI 99/4A
- Commodore 64
- Commodore Vic 20
- Commodore Amiga
- Mattel Intellivision (over 50 sealed titles available)
- ColecoVision (over a dozen sealed titles available)
- Atari 2600
- Atari 5200
- Atari 7800 (over a dozen sealed titles available)
- Atari Jaguar
- Mattel Handheld Games
- Coleco Handheld Games

If you are interested in any of these items, please respond by emailing me at jim_l@NO.SPAM.telusplanet.net?subject=Classics (removing the 'NO.SPAM'. first). I am located in Edmonton, Alberta, Canada, but ship worldwide, dealer inquiries are welcomed. I am also willing to accept trades of certain classic computer, video games, and handheld items, please contact me for our want list.

You don't need it at all. You can print from every GEM application
without lpdev.xdd.
The sources of lpd can be found on
http://www.funet.fi/pub/atari/mint/lpd-590-mint.tar.gz.
Send me a mail if you need a compiled version.

part of the man file of lpd
==========

LPD(8) System Manager's Manual LPD(8)

NAME
lpd - line printer spooler daemon

SYNOPSIS
lpd [-l] [port#]

DESCRIPTION
Lpd is the line printer daemon (spool area handler) and is normally in-
voked at boot time from the rc(8) file. It makes a single pass through
the printcap(5) file to find out about the existing printers and prints
any files left after a crash. It then uses the system calls listen(2) and
accept(2) to receive requests to print files in the queue, transfer files
to the spooling area, display the queue, or remove jobs from the queue.
In each case, it forks a child to handle the request so the parent can
continue to listen for more requests.

If anyone is looking for ATARI 8-bit or ST software / hardware, please take a look at my site as noted below. Please feel free to make an offer if you feel the price is too high (or heck! If its too low feel free to offer more!) SMILE! These are items that I used personally. I would especially be more likely to deal on volume purchases!

I have 3 INDUS GT PLASTIC DISK CASES that have a lot of 5 1/4 diskettes that would need to be erased before they could be used for scratch. MAke me an offer for these as they are not listed on the WEB SITE!

Revised 09-03-01

I am getting rid of all of it. It s taking up space and I'm not using it.

I want it to go to a good home not somewhere it might get dumped.

I will take offers for everything. You pay shipping.

Keep in mind that this is in the U.S. and that you're check or money order
must clear BEFORE I ship it. I can also take credit cards.

Email me at fmatzen@home.com

3268. New Location for Tims Atari MIDI World

Newsgroup: comp.sys.atari.st
Date: 2001-09-05 01:47:16 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0109041747.1ca312f0@posting.google.com>
Source record: 42238

Hello fellow Atarians

Rob at Atari-Users.net has graciously offered me webspace on his server as I was having major problems with Netscape.net

I am happy to announce the new location of TAMW (Tims Atari Midi World)

http://tamw.atari-users.net

Hows THAT for an Atari-related address! A little bit easier to remember as well. Just got thru editing all the htm's and taking out the netscape.net banners and then ftp-ing the whole thing to the new address.

Please check out the new location and let me know of any problems and UPDATE YOUR BOOKMARKS!

Also, any tips to make it better! I am only a novice when it comes to HTML work, but any suggestions would be most helpful.

The netscape .net location will still be there, that is when you can get into it!:-)

3272. problems with Atari TT & Steinberg Atari Midi-3 (3out, 1in)

Newsgroup: comp.sys.atari.st
Date: 2001-09-05 05:59:10 UTC
From: DiscoFreq <discofreq@geejemix.net>
Message-ID: <Oajl7.36286$6x5.7902780@afrodite.telenet-ops.be>
Source record: 42242

Hi,

I bought a Steinberg Atari Midi-3 some years ago, but I just started using it now (bigger Atari). The problem is that I added the drivers on the right location as said in the manual, but I still only have the options "MROS" and "ATARI" in OUTPUT, no "STMI3 1", "SMTI3 2" and "SMTI3 3" as there should be...

some more info:
I use Cubase Score for Atari, v2.0, on an Atari TT030 (installed on harddisk, not from floppy)

I hope my newsserver gets the replies, because it's often incomplete :(
You can also contact me on my site (forum, mail, MSN, ICQ)

Yes. One bottle of Nickel Print, or car rear window heater element silver patch, one toothpick and a lot of time is what is involved. Put a small drop of some metal-containing liquid on the break, which is not in an etched copper trace, and cannot be soldered to, and wait a few days. The stuff dries slowly. Where the break happens is at a sharp edge in the base, so smooth that edge off, and cover it with any handy tape.

At the end of those few days, re-assemble and use. Rush the job and you will do it twice.

OK :) Single click on the file you wish to rename and then go to 'File'
and go to show info I think it is. Then put the cursor on the filename
and type the new name and hit enter. I haven't used TOS is a while but
that's the basic way.

Is it possible that the host adapter doesn't work with 240 MB or
higher drives? The Atari doesn't boot when I connect only the
540 MB drive (the terminated one). After adding the 52 MB
drive (not terminated) it works.

I'm looking for an installable device driver for MiNT, not a print spooler daemon. I realize that printing is possible without it, but I'd like to find it and give it a try. I'm still looking for a solution to the problem I'm having printing web pages from CAB with NVDI5. When printing to the parallel port, the output is corrupted part way through the second page if more than one page is required. So far, this only works when I redirect the output to a file and then use the Unix "cp" command to copy it to /dev/centr.

Thanks a lot, I had been looking in that window, but I was trying to change
it in the line above (with the full path)...
And yes, changing the extension from .dr to .drv solved my initial problem

Thanks to both helpers,

3297. Re: Atari TT - TT RAM card problem...

Newsgroup: comp.sys.atari.st
Date: 2001-09-06 00:00:09 UTC
From: peter.goffee@ntlworld.com
Message-ID: <3b96bb0c.44020033@news.ntlworld.com>
Source record: 42169

Okay, I did something very similar recently, installed a board in my
TT and upgraded it to 16 meg ram. You simply install the TT card
inside the TT. No need to alter anything inside the TT itself, it's
all on the card.

You have the right type of memory. My problem was using 3 chip memory
SIMMS. The machine kept locking up. Upgraded to 9 chips, and it
worked.

You need to set those switches. Attempt:

W101 link pins 2-3
W102 link pins 2-3
W103 link pins 2-3
W104 2-3
W105 2-3
W106 2-3

I think the pins are 1, 2, 3 going UP the board, but can't remember,
and not about to open my TT up! If nothing works, assume the pins are
actually 3, 2, 1.

If this is what you've actually done, you very likely have a broken
board. Remove it, and check all the pins are alright. Then attempt to
put it back on, pressing down.

Hi All,
Pagestream 2.2 SE takes forever to load into my Falcon MKI (14meg)
with Magic 6 & NVDI 5. So I was wondering if anything can be done
to get it to load faster! It loads super fast with Warp9 installed
instead of Magic and NVDI. Acoording to PRGFLAGS.PRG, the loading bit
is set for fastload. Any thoughts?

Twilight doesn't like Appline IME, every time that the saver cuts in, it's
promptly ejected again. Pity really.

I'd be interested to read your view of the club actually :-)

But anyway, the Cheshunt Computer Club is here to support Atari users at its monthly meetings - the next one is on the 26th September at the Wolsey Hall, Cheshunt, Herts (UK). Not far from the M25 J25.

Other meeting dates and a map are all to be found on my web site (CCC section), URL in sig.

MegaST keyboards can be recognized by slanted function keys. Inside, they
are Cherry keyboards and they are excellent- in fact, among the best
keybopard I have worked on.

MegaSTE keyboards can be recognized by smaller, rectangular function keys.
AFAIK they are much worse than MegaST ones, in fact, they are not any
better than ST-series keyboards, which were of the same type.

Both shapes of keyboards are supposed to be functionally identical.

>Is this Yamaha chip easy to find/identify?

Yes, it should be just under the floppy drive and labbled 'Yamaha YM2149F'.

How about putting it into one of the not to be displayed list in
appline.inf? It may be that Twilight becomes topped or something and so
appline does something and then twilight sees and interuption.

I have a large selection of classic computer and video game hardware, software and accessories for sale, many from private collections. Many of the items and game titles (for Intellivision, Colecovision and Atari) are still available in shrink-wrapped/brand new form, ideal for anyone just starting a classic computer or videogame collection.

Currently I have items for the following models/systems...please email me with the categories you are interested in, to receive a detailed listing.

- Atari 8bit Computers
- Atari ST Computers
- TI 99/4A
- Commodore 64
- Commodore Vic 20
- Commodore Amiga
- Mattel Intellivision (over 50 sealed titles available)
- ColecoVision (over a dozen sealed titles available)
- Atari 2600
- Atari 5200
- Atari 7800 (over a dozen sealed titles available)
- Atari Jaguar
- Vectrex
- Mattel Handheld Games
- Coleco Handheld Games
- Classic Computer Magazines (PC Magazine, Compute, Antic, PC World)

If you are interested in any of these items, please respond by emailing me at jim_l@NO.SPAM.telusplanet.net?subject=Classics (removing the 'NO.SPAM'. first). I am located in Edmonton, Alberta, Canada, but ship worldwide, dealer inquiries are welcomed. I am also willing to accept trades of certain classic computer, video games, and handheld items, please contact me for our want list.

G Swaine wrote:

> Is there a difference between Mega ST and Mega STE keyboards?

IIRC, from the days when I used nothing but Ataris:

The only difference between the Mega ST, TT, and Mega STE keyboards are their construction. My Atari dealer was always interchanging TT and STE keyboards between the different computers as he needed. And I was always swapping between my TT and Mega ST.

The Mega ST keyboard uses real switches, the other two are membrane construction, and those two are identical internally. Externally, the last two are different, the STE having a different color. I can't remember what the function keys looked like on the STE, tho', as the STE models are the one Atari model I've never owned.

The original Mega ST keyboards had a design problem lots of typists disliked. The keycaps themselves are slightly larger than "standard", and a lot of people made typing mistakes because their fingertips would hit one of the surround keys when you were typing. From center to center of the keys was standard, the gap between them was not.

The TT keyboards, and presumably the STE keyboards also, are susceptible to having a chip destroyed by static electricity. Been there, done that, more than once. <G> I have a spare Mega ST keyboard, and I just plug that one in whenever I blow up the TT keyboard. Then I would order a new chip, swap it out, and go on. I moved in 1998, and since then have not had that misfortune.

The membranes were indeed made by Mitsumi, and I believe Best Electronics has a supply of them. I know I've replaced my TT membrane one time due to the broken trace. At the time it was $30, and that was less than the hassle of repairing one.

The link 96 and 97 have far better scsi support including cd-r drives which don't always work as well with the original micro adscsi and is also much easier to find. the micro adscsis is a last resort no more.

Hi James,
16 vs. 48 does make sense it should load faster. Here, it's the same
machine but different Auto folder programs. It's really no biggie to
switch Auto folders (one for PGS, one for CAB, etc.) so it's just a matter
of convenience if I can get PGS to load with Magic & NVDI as fast as
with Warp9 (from the good ol' ST days!).

I strongly disagree. OK, they're better than ST-keyboards, but not
much. The keys are large and flat, they have very poor feedback and a
"spungy" feeling. It feels almost exactly like the original Falcon
keyboard, just a bit noisier. They're built like a brick house though,
you'll probably wear out your fingers before the keyboard.

> MegaSTE keyboards can be recognized by smaller, rectangular function keys.
> AFAIK they are much worse than MegaST ones, in fact, they are not any
> better than ST-series keyboards, which were of the same type.

I disagree with you on this too ;-) The TT keyboard is the best
keyboard Atari ever made. The keys are well designed and the feedback
is good. The Stacy also has a very good keyboard (best feedback of
them all), although a bit smallish.

>
>I strongly disagree.

Well, I suppose that the element of personal taste enters the equation too :)

>The keys are large and flat, they have very poor feedback and a
>"spungy" feeling.

I did not get that impression- to the contrary! Maybe the keyboard suits
me particularily because it feels similar to DEC's VT keyboards which I
use at work.

>They're built like a brick house though,
>you'll probably wear out your fingers before the keyboard.

I agree with -that- ! It is rare to see a keyboard built so rigidly
and as massive as MegaST one (I think it has more than 1.5kg).

>> MegaSTE keyboards can be recognized by smaller, rectangular function keys.
>> AFAIK they are much worse than MegaST ones, in fact, they are not any
>> better than ST-series keyboards, which were of the same type.
>
>I disagree with you on this too ;-) The TT keyboard is the best
>keyboard Atari ever made. The keys are well designed

You -are- talking here about the TT/MSTE keyboard- the one with rectangular
function keys and membrane keys contacts inside, aren't you? Then each
to his own taste- let's agree to disagree :)

As for the matter of visual appearance I have no great love for the shape
of function keys on MegaST board (although they look nice visually),
so the MSTE layout may be better in this detail- but I would have preffered
standard key shapes here.

> >
> >There's mention of an Atari Club on your site, would you be so kind as to
> >post some details kind sir.
>
> I'd be interested to read your view of the club actually :-)

Well personaly i never miss it actually. There's always plenty of advise flowing, people turn up with problems and find that there's always help and usually its of a practical nature. There's alway a good show of Atari machines running various permutations of operating system and desktops. There's also a mild spatering of hardware surgery from time to time. Its a good place to try and locate that bit of software youve been after for ages, there's quiet often a small personal table sale going on where you can find a piece of used commercial software and there's also a few 100 megabyte of PD available to peruse.

And if you find nothing else of interest there's always the free hot drink and bickie, you only start to pay for entrance after a couple of visists so there's no reason not to come and try it out.

Apex Media has a option for a Genlock. The Apex Manual doesn't go into which Genlocks work with this option. Or what benefit this option gives when using a Genlock.

Anyone know which Genlocks work with the Apex Genlock option?

Also, What is the purpose of the Apex Media Genlock option?

I have 2 Genlocks (different models).

Yeah it makes sense to me, I understand your need cause I still do use it on my regular STe quite often. Not everyone has a TT or Falcon but still need to speed up pagestream. I was surprised that when you use nvdi it doesn't speed it up as much. I have heard nvdi was quite good in improving performance at least as far as vdi stuff and some of the gdos functionality it provides.

Hi everyone,

I haven't fiddled around with mint for quite a while. I am wondering about something. I've been told that hddrive can access a partition up to 1 gig on a TT if mint is running on the system. My question is if I can install a minimal mint package so I can use a 1 gig partition without needing a full mint install with its own minixfs partition and a full linux / unix type of setup that I don't really need.

thanks,
James

You don't need to install anything else but mint.prg and a recent
version of HD-Driver if you want to use huge partitions. If you want
to use TOS-compatible partitions you're stuck with FAT16, I'm not sure
what the limit here is but 1Gb sounds reasonable. If you want you can
also use FAT32. I don't know the limit here either, but it's in the
Terabyte-range IIRC. Recent versions of MagiC also supports FAT32.

3342. Falcon and PC Floppy drive

Newsgroup: comp.sys.atari.st
Date: 2001-09-08 10:44:49 UTC
From: Thomas <tjw@zhell.co.uk>
Message-ID: <3b99f259$0$4907@news.zetnet.co.uk>
Source record: 42062

Hi everyone,

Recently my Falcon floppy disk drive packed up (after I attempted to insert a disk
in it that was not in the best of health). Even after cleaning the heads the old disk drive will read but not write. As the old drive was a bit wobbly at the best of times I decided to splash out on a new PC high density disk drive thinking
that it would work. Er no, two different makes of drive later and no joy. The Falcon doesn't detect the drives there at all.

My machines a CLab Mk 1, with fourteen megs.

Any Ideas?

Thanks in advance!

regards,

Thomas Wellicome

Unknown hardware patch? Well do a search at http://groups.google.com and
you'll probably find dozens of posts on how to fix a floppy drive for use
on an Atari. I've said it hundreds of times so I won't do it again!

There is essentially NO fundamental difference between the floppy
drives Atari or the clone makers used, and the "standard PC" floppy
drives available today.

One thing that must be checked however-

Atari systems are configured to address floppy drive A: as Device 0

ALL of the PC drives available in the world come pre-addressed as
Drive 1 (for reasons lost in the misty dawn of computing).

You MUST change the drive addressing jumpers on the PC floppy to make
the drive Device 0 for the Atari to be able to see it.

There USED to be tiny jumpers on the floppy drive PC board that let
you change the DRIVE SELECT line, but since practically no one (except
possibly Atari owners) ever changed them, most manufacturers have
eliminated the physical jumpers from newer drives.

Now, most drives have solder pads on the PC board which may have a
"zero ohm" resistor (essentially a wire jumper) soldered between the
DS 1 pads, or just a solder blob shorting the pads together.

You must examine the PC board with a magnifying glass to find the Drive Select jumper pads and change the jumper, whatever it is, so it shorts the DS 0 pads.

(This is all experience from the ST world, but if Atari held true in its design of the Falcon, it probably holds for the Falcon and its clones.)

Try it and see if it helps.

You should be able to connect your Syquest drive to the SCSI port on your PC. If you can put the files on a TOS/DOS compatible partition on your Syquest cartridge (possible using HDDRIVER) then there should be no problems as long as Cubase PC is happy with the Atari .ARR or .ALL formats. If it isn't then converting to General Midi files is the other possible route.

I assume you have a hard drive on your Atari you can transfer the files to while you create a suitable partition on the cartridge. IIRC correctly you will have to devote a complete cartridge to this, I don't think you can have mixed types of partitions on the same cartridge. (Uwe will hopefully correct me if I'm wrong.)

Cheers

Paul

Source record: 42072

I have an ST with a duff floppy drive. "No problem" , I thought, "I have an old Amstrad PPC with a pair of 720k drives, that'll do". Checked the jumpers on the drive, set them to ID0, great. Hooked it up to the ST, and it does the weirdest thing - if I boot from the disk, it'll go to the desktop, I can get a directory, but if I try to access anything, the drive head clicks twice (as if it's trying to move backwards), then moves forwards; the ST then reports a problem with the drive. If I select "retry" it continues until the head is banging against the endstops.

The weird thing? Both drives do the same. Both drives work fine on an Amiga I have. And no, it's not a floppy controller problem, cos if I use my external drive in place of the Amstrad one, it works fine too.

Ideas anyone? The drives are Panasonic JU253A11 720k ones.

Cheers

Hi James,
I believe NVDI speeds up grahocs but I don't see ie it speeding up
program loading (no where near antique Warp9). With Warp9, PGS loads in 2
seconds! With NVDI I wait 30 seconds and re-boot with Warp9!!!

I use FontMonger on the Mac to convert all kinds of Mac & PC True Type & PS fonts and then use Fonty to convert those to Calamus format. Works great!

Thanks Jo,

I'll be trying that first. I already have hddriver working (the latest version) getting it running
with my perticular combination of drives was an adventure in itself. Getting my TT up to some new
tricks is a new thing from my STe (which I still use as well)

Hello,
I browsed soundpools website today.
Do you mean an SPDIF Interface? I didn't see FDI.
Only SPDIF, Adat and one other (8 outputs)

>
> You will, of course, need a device such as a DAT machine, so you can
> use it's converters (A/D to send to the FDI input, and D/A to receive

> Falcon.
>

I couldn't see the jacks to clearly on the picture. (SPDIF Interface)
Does it have to be a DAT machine?
Would a Tascam cassette deck work?

I tried sending a test signal with an attenuator through Logic Audio.
So far unsucessful. Logic Audio won't record. But I will try something
tomorrow.
I did try the test with Falcon D2D
It recorded, but it was just as Claes said.
Too much line noise.

thanks for your email

3359. Atari-Midi programs now work on PC

Newsgroup: comp.sys.atari.st
Date: 2001-09-09 05:22:28 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0109082122.7db42ec3@posting.google.com>
Source record: 42081

Hello All

For those that do not know, those wonderful Atari-Midi programs of yesteryear (and present year)can now be run under Emulation on a PC using STEEM. Its Free as well.

The official Steem Site:

http://www.blimey.strayduck.com

Then you can go to my site and download some of the best Atari-midi software which includes ALL the caged artist series of Synth editors, as well as Dr T's KCS Omega, Master Tracks Pro, RealTime, M, Tunesmith, MidiAxe,Camus,Ludwig, Edit Track, and LOTS more. There are more coming in as well. Never knew that there were so many Atari-Midi programs. Be sure to read my Download Faq if you are using a real Atari. Other wise, just unzip the programs into the folder that is Steems virtual HD on your PC.

I am also the moderator of the Atari-Midi Mailing list at Yahoo groups. We are over 265 members strong. This month we are exploring Dr T's KCS sequencer, and the Doctor even joined us! (Emile Tobenfeld)Learning a lot of stuff.

Details on my site about the above:

Tims Atari Midi World

http://tamw.atari-users.net

Would invite comments. Atari has not died. Looks like it is given a new life through the Internet and its users. Now that Atari programs work on a PC, there is an opportunity to try out some very unique programs that have finally seen the light of day. Of course those that have REAL ataris' can benifit even more, giving new life to to a beloved platform.

What about the old Conner 20/40 MB SCSI hard disks that came with the
Stacy? Do they autopark?

I still have a link to SHIP.PRG on my Stacy desktop.

I missed the original posting...

On a real 1040STE in my opinion TOS 1.62 is the best if you need compatibility with all Atari software. TOS 2.06 will not work with all software, but it is probably 90% compatible with all.

If one needs the features of TOS 2.06, then just use NEODESK 3 or 4 and you'll have all the features of TOS 2.06 and more.

Even better if you can get a switchable TOS 1.62/TOS 2.06 board to install. I'd like to find one or two of these my self.

BTW, can the IDE interface board for the 1040STE still be found? I am looking for one of these in the US/Canada.

3372. Logic Audio question

Newsgroup: comp.sys.atari.st
Date: 2001-09-10 03:08:37 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3b9c2fb6$0$12829$272ea4a1@news.execpc.com>
Source record: 42094

Hello,

I have been trying to record an Audio Track with Logic Audio.

I get the signal from tape deck --> mixer --> Falcon.
Line level readings are showing up on the meter within the program.
I hear it quite well through headphones out of the Falcon.
(and Falcon monitor speaker)

It seems to be recording, but it doesn't save the track.

Setting an Audio path is strange.
It calls for a path.
I type in for example, K1.AUD
It creates K1.AUD and K2.AUD
Then it says: Can't prepare next record file on disk "L"
(Error: -1048)
Set New Record/Path?

I also get the (Error: -34)

Is anybody using this program that might know what this means?

Midi tracks work fine. Records and saves.

thanks

ken

Hi Matt

You are tak'in MAC right? There is an emulator called NoSTalgia which
(after much configuring) works with Atari-Midi programs. Just do a
google search and the site should come up. I do not use Mac, but I
have had reports that it works.
Harry Koopman (programmer of MidiJoy) got it to work with his program.

RealTime, however ironically does not work in Steem (nor does M)so I
wonder if it would work on a Mac using NoStalgia. If you get them to
work, please let us know!!

Hi Ken-

I KNOW I've had that problem before... if only I could rememeber what the simple solution was. I think it was something in the Set Audio Path procedure. Maybe try NOT putting the file extension in there. Let Logic do that. It will also assign an ascending number to numerous takes. Make sure the partition, or folder DOES exist. And of course, make sure to defrag your hard drive before starting any project. If my memory ever kicks in, I'll make other suggestions. If you DO find the solution, let us know.

As no surprise, your TOS error number means: "path not found".

Clayton Murray
Seattle, WA USA

Here is the TOS error number list

TOS error messages
----
message no. meaning of message
---------- ------------------

```
1 general error
2 disk drive not ready
3 unknown command
4 CRC error- disk checksum wrong
5 bad request
6 seek error- track not found
7 unknown media- bootsector wrong
8 sector not found
9 out of paper
10 write fault
11 read fault
12 general error
13 disk write protected
14 media change detected
15 unknown device
16 bad sector (verify)
17 insert other disk (request)
18 insert disk
19 device not responding

32 invalid function number
33 file not found
34 path not found
35 too many open files
36 access denied
37 invalid handle
39 out of memory
40 invalid memory block address

46 invalid drive specification
48 cross device rename (not the same drive)
49 no more files

58 record is locked - (file locking and network)
59 no such lock (unlock an unlocked record)

64 GEMDOS range error- seek wrong?
65 GEMDOS internal error
66 invalid executable file format
67 memory block growth failure

80 too many symbolic links
200 mount point crossed (indicator)

BOMBS and what they mean
------------------------
no. of bombs explanation
------------ -----------
1 not applicable
2 bus error (user does something the ST doesn't permit)
3 address error (usually error in program)
4 illegal instruction (two prgs using same memory space)
```

5 division with zero
6 CHK instructional error
7 TRAPV instructional error (usually ROM error)
8 conflict with a privileged command
9 trace vector error
10 line 1010 instruction- line 'a' error
11 line 1111 instruction- line 'f' error
12 not applicable, reserved
13 FPU protocol violation (TT/Falcon)
14 format error
15 unitialized interrupt vector
16-23 not applicable, reserved
24 vector 24 error (might be MC68901 and/or GLUE chip)
25-31 auto-vector interrupts
32-47 TRAP exception Vectors
48-55 MC68881 FPU exception vectors
56-63 MC68851 MMU exception vectors
64-79 MC68901 MFP vectors
80-95 MC68901 MFP vectors (TT only)
96-111 Zilog 86C30 SCC vectors (MegaSTE/TT/Falcon only)
112-255 undefined

** A large number of bombs might be the total of several errors.

Hi again Ken,

Another thing, did you "Set Record Size"? It's possible you have to set a size for the recording BEFORE setting the path. Are you sure there is enough space on the hard drive to accomodate the size you set? As you can probably see, it's been awhile since I did any audio stuff with Logic.

3377. Dum Newbie SCSI questions...

Newsgroup: comp.sys.atari.st
Date: 2001-09-10 09:21:35 UTC
From: parris_k@yahoo.com
Message-ID: <aa5c37da.0109100121.6ae1937@posting.google.com>
Source record: 42099

I have an ICD link adaptor and a 40 meg harddrive.

I replaced the 40 meg Harddrive with a 2.1 GIG one, and I am now
trying to get it to work.

I am using the proprietary ICD software that came with the link
adaptor, I have TOS 1.62 (I think)

My questions:

Is the drive too big for the atari to be able to access it all?
What size should the partitions be?

Can I expect to just be able to plug it in and get it to work? at the
moment it appears to have one big partition on it, but if I try and
install a drive pointing to "c" it tells me no suitable partitions
were found..

Any help/URLS/ Driver software reccomendations gratefully accepted..

/Tom

The drive is not too big (you can connect drives of any size to the
Atari), but the maximum partition size for TOS 1.62 is 512 MB.

Better by far is to html-ise the text and stick it on your web site, and point
Altavista at that instead. I find I get better results that way.

3381. Atari Disk Drive Seek Rate

Newsgroup: comp.sys.atari.st
Date: 2001-09-10 15:04:25 UTC
From: phantomm@bellsouth.net
Message-ID: <ZD4n7.130444$ZJ.1259722@e3500-atl2.usenetserver.com>
Source record: 42103

I've ask about this before, but either missed the replys or didn't get any answers on this subject.

I've read conflicting information about the Atari Disk Drive seek rate.

When using NeoDesk 4, the Control Panel States the following....

6ms: For 5.25 or 1.44mb drives.
3ms: For 3.5 drives.

Now on the Atari Falcon should the internal 1.44 disk drive seek rate be set to 6ms?

What about the MegaSTE with internal 1.44 and Atari TT with internal 1.44?

And should other Atari internal/external 720K DS/DD disk drives be set to 3ms?

I've always used 3ms on Atari internal/external 720K DS/DD drives without any problems on Atari 1040STE.

But on the Falcon, I've also only used 3ms on the internal 1.44 drive when using Geneva/NeoDesk. I am not sure about normal TOS 4.04 though, Does TOS 4.04 set the internal 1.44 disk drive to 6ms or 3ms?

I have read else where that 3ms should be used on Atari 1.44 and 720k DS/DD drives. This seems to conflict with the NeoDesk 4 Control Panel Floppy Disk Configuration option as stated above.

Is there a CPX or program that will show what the Disk Drive Seek Rate is currently set for on any Atari ST-Falcon in TOS and with other OS/DeskTop?

Someone who really knows enlighten me on this. :)

Hi

Sadly, after many years I have finally got to the point of clearing out my old Atari ST/Falcon stuff. I was originally just going to give it away because I dont think it has any real value now, but the thought of how much I've paid for it all makes it soooo difficult. Everything in original boxes c/w manuals, all perfect condition. Someone make me an offer... :)

> did any audio stuff with Logic.

Hi Clayton,

Thanks for your response.
Yes, I set the record size for a simple test of 1 minute.
I copied the whole program over to the partition that I wanted to
record on.
It seemed like it bombed less, than when I had it in another location
and specified a path for the .AUD files.

BTW, I did not type in the extension .AUD
I armed the record button(s) in the "VU meter"
It called for a path. I typed A1
It created A1.AUD and A2.AUD
When I cancel out of the file selector, I get the error messages.
Sometimes I don't get them if I select A2 again. (replacing the file)

Also, I do not think I would even need an attenuator between
the mixer and Falcon. There were plenty of places to adjust the volume
within the program. This means I could set my mixer to higher levels,
meaning less line noise.
Too bad I can't record an Audio Track!

ken

The link doesn't appear to work... ?

Are they original ST's or STe's? Where are you based? I'd love another
ST for only $50!

Hi All,
I've finally got around to installing the PhantomSE and now need a
fan for the CPU. The qustion is: can the Falcon MKI power supply handle
the extra current draw of a second fan. I'd like to get one that sits on
the CPU but a more powerful and hopefully quieter fan that fits in the
same place as the original may suffice.
I would also rather buy it from an Atari dealer that is still actively
supporting Atari rather that a PC store or Radio Shack!!!

Thoughts welcomed,
John G.

Small CPU fans take very little power, I really wouldn't worry about it.
You might as well buy from Radio Shack unless you can be bothered to order
a fan from abroad or if you're lucky to have an Atari stockist near you.

I remember having this problem. There is a keytabls.sys in the xtension
folder. You need a small program to re-write this file to your language
IIRC. I don't have that program but I guess it would have been supplied
on your Magic installation disks.

I'm guessing that its AHDI that you're after, this is freely available from
a lot of online sites, try a web search with "AHDI" as a parameter.

OK, I got it sent to me by some kind sole from here so hopefully someone
will pop it over to you. I don't have it anymore as I run the English
release by Atari Workshop which has that file made for you. There is a
program that can create these small files. If no one sends you the
program I'll send you my keytabls.sys if you email me.

There's no douobt that the TT keyboard is subject to broken traces on the mylar. Mine broke the Control circuit a couple of years ago, which I repaired with a soldered wire link. Subsequently I had it replaced. I do not know who made it (Made in Malaysia, it says, nothing else).

My Hades came with a Unikey keyboard, which is lovely, beyond compare :)

Charles.

Hi All,

Thought I'd post some good news for a change :)

I opted for Wizztronics' RAM card for my Falcon MKI (mainly 'cause they are in the US in case there's a need for phone calls and also because they advertised the board as layered for insulation against interference). The PhantomSE excellerator works perfectly with no video distortion or crashing now! Although a bit rough to install the Phantom, I'm now enjoying a 50% increase in overall speed (CPU fan to be installed next).

Thanks Lyndon & Edward...

I've now got the files to change the keyboard back to UK (Keybd105).
Unfortunately I cant get Magic5 to take it without giving
68000 Exception, Error #69, but what I can't fathom out is why my
keyboard mapping got changed in the first place!
I'm rapidly loosing faith in Magic5 as it seems fussy with a few prg's.
Does any one know if Magic6 is likely to be better?

Martin

I'd Like to see that, My CT2 falcon takes around 30 Seconds. I had culled the fonts folder a little as there were around 50 Fonts. This helped Naff all. I will have a crak a the Fast load bits tho. Knew about the PRG but not drivers etc

Hmm, I never got this problem. Maybe I should send you my UK keytabl.sys?

>I'm rapidly loosing faith in Magic5 as it seems fussy with a few prg's.
>Does any one know if Magic6 is likely to be better?

Well, you could run Mint which can be more compatible to TOS. I found v6
of Magic better. What programs are fussy for you? Things like Cubase
should be run from TOS. Old programs are usually fussy.
I can't remember if v5 of Magic supported the xtension folder, or
keytabl.sys, so the magic.ram may need to be edited. Don't know about
that, sorry.

Hi, I'm Ben Smith of Bravo Sierra Computers. I sell Atari Computers and Atari Jaguar Games. The Great Communicator once said, "It's a Recession when It's in your Neighbor's back yard. But when It's in your back yard, it's a Depression!". Usually Atari sales depend on Customers with extra income. Money over and above what it takes to pay bills. This has cut into my livelyhood. With the current economy as it has been. I'm looking for Atari Customers with extra income! Especially repeat customers familiar with the way I do Business! My Specials, Sales & Discounts still apply! So check my HotLinks below, E-Mail me at atari@pacifier.com or call Ben anytime at (503)256-9974!

http://www.pacifier.com/~atari/specials.htm Current Atari Specials.
http://www.pacifier.com/~atari/ Benjamin's WebSite.
http://www.pacifier.com/~atari/jagsales.htm Jaguar Catalog Link.
http://www.pacifier.com/~atari/free_cat.htm FREE Catalogs info.
http://www.pacifier.com/~atari/catalogs.htm FREE Catalogs area.
http://www.pacifier.com/~atari/testing.htm My Test Standards.
http://www.pacifier.com/~atari/antispam.htm Spamming News!

Check HotLinks above for specials on my WebSite! Two 20% Atari Discounts! General 20% SoftWare Discount & Repeat Customer Discount! 20% off all SoftWare for Atari 8 Bit & ST! And if your a repeat customer, 20% off ST & 8 Bit Hardware/Accessories, Software/Games, Books & References. Discount does not cover Happy Drives, xf551 Drives, Monitors & Jaguar! Discounts are like coupons, redeem by requesting Discounts in E-Mail.

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

```
Drivers(printer, import/export filters,...) are little .prg.
So Fastload Bit works for them.
You can also try with 4Mo instead of 16Mo and you will see a small
difference too(without fastload bit)..

Should be the one, I believe. I also have KETAB06.PRG in my
GENSYS\MAGIC\START\ folder, but have no idea what that does.

Just one thought: Perhaps the NVRAM has somehow got changed from
British to American keyboard? Check with NVCONFIG.CPX.

Regards, /Peter/

It's an extension used by some programmes to select various charsets
(not the system charset), Chatter is an example.

Bye,
/Pascal/

3429. [news] Icon Extract 1.2

Newsgroup: comp.sys.atari.st
Date: 2001-09-14 06:11:32 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3BA19F94.4040407@club-internet.fr>
Source record: 42001

Hello,
Excuse me for my english.

Here is the new version of Icon Extract 1.2. This one supports icons 32 bits of XP windows. The interfacing in fashion 2 and 16 colors have been improven and the display is correct in monochrome fashion.
Small recall, this program permits to recover icons windows to the ICO format, CUR, ANI as well as librerians of icons to the ICL format and DLL. All icons in 2, 16, 256 and True Color (24 and 32 bits) are saved in a RSC file (as the DESKICON.RSC). A RSC file is created for every size of icon (16, 32, 48, 64, 72, 96 and 128 pixels).
The installation is achieved with GEM Setup 2.01.
It is recommended to have a fast machine (68030 + 68881/2) or to work with Magic PC or Magic Mac.
Good downloading and see you later for the version 1.3 (suuport of the XPM files of the Linux world). Bests regards,

F.LAFABRIE

Thank you! We here in the states are in a bit of shock from it all as you can well imagine, but I have never seen United States citizens so united, or the world for that matter.

While I'm happy to see so many people biting their upper lip and showing courage I never knew possible... I really hope the people of the world find those responsible in the most reasonable way possible.

I know we have Atari users in all parts of the world. ALL.

I don't want to see some of my fellow users in another country get knocked out just because of the actions of relatively few. That's my thinking on it. Hope we can work together, call those that did it out, and work together to keep it from happening again. (And learn from this)

I hope... I hope...

Source record: 42006

I've seen SCSI to USB adaptors "to connect a SCI device to the USB port on your PC", but not the other way around. Are there indeed any USB to SCSI adaptors, so that I can attach a USB device to my Falcon, or do these SCSI to USB adaptors work in reverse too? How would the SCSI ID be set? Do USB devices have a similar concept and the ID would simply be passed through as a SCSI ID?

3437. Digital cameras

Newsgroup: comp.sys.atari.st
Date: 2001-09-14 18:15:21 UTC
From: osian@zetnet.co.uk
Message-ID: <3ba24939$0$4911@news.zetnet.co.uk>
Source record: 42007

I'm looking for a digital camera to work with my Falcon. The Sony Mavica range store images on a floppy, but they seem to be a lot more expensive that other cameras. Is there anything else that's Atari-compatible, e.g. is there any software available to download from a digital camera, or is there an external device that will take images from a camera and put them onto Atari-compatible media such as a floppy?

A friend has a 'floppy disk emulator' with his camera, but it requires PC driver software. I tried putting it into my Falcon, but I couldn't see any files on it.

We cannot allow terrorists to change our way of life. We will endure.

The Atari Times will continue to update on a regular basis and will
honor those brave persons who died in the attack.

New Material this week include:

NEW - Raiden Redux review by Brian Rittmeyer.
Updated - Dear Fruitman on Politics in Video Games.
Reminder - Change Your Bookmarks to www.ataritimes.com. Geocities may
not always be the web provider...

Someone to lift your spirits - If this doesn't make you feel patriotic,
nothing will.
Talk about this Unbelievable Day at The Atari Times Boredroom. Talking
about it always helps.

when I was writing for Atari Computing I remember an article where
the writer discovered a SCSI card reader made by Microtek, which allowed
him to plug in the RAM cards from the camera into it and it would show
up on the desktop as a disk drive (this is using HD Driver). The cool
thing was that not only could he copy the files from the cards onto his
hard disk, he could also copy graphics files onto the RAM card!

This was a few years ago, and I'm not sure if the RAM cards are the
same now or even if that card reader is still made, but it's something
you might want to check out.

3445. SAM V. 1.3

Source record: 42014

I've been using a modified version of SAM 1.2 with Geneva/NeoDesk on my CT2B Falcon. The other day I tried the bug fixed 1.3 version that I had on my hard drive.

To make a long story short, it doesn't work. version 1.3 gives me weird AES Errors when trying to bootup with it. I've changed the FastRam settings and FastLoad Bit On/Off but nothing helps.

I also changed things around so that SAM 1.3 could be Ran as a program. I managed to bootup fine with the SAM.PRG in the Auto Folder, but when I ran the main SAM file it grabs all ST Memory and only has 9 seconds of recording time. Very Strange!

So maybe I have a corrupted version 1.3 SAM Zip file or a program that is seriously conflicting with it.

Anyone have SAM version 1.3 working on any Falcon using Geneva/NeoDesk?

And anyone using version 1.3 or any version of SAM with a CT2B Falcon? The modified version 1.2 I have does work but doesn't take advantage of the extra FastRam. Which is what I am trying to get working with SAM if possible.

Also, can anyone suggest a Audio recording program that will record in Memory and use the FASTRAM of the CenTurbo II B version?

I have plenty of good D2D programs, but very few programs that record Audio in Memory.

Nobody had an driver that make it usable on atari.
(I never seen an SCSI-> USB device)

Next is that most of USB/SCSI adaptors are not work round at all.
(People report that not all SCSI devices work and it is slow around)

Works fine since years here. (HDDriver 7.8)
Use ID scan, switch on SCSI ID where your ZIP is connected to.
Save driver to boot. Reboot. Ready to use.

I don't think there are USB to SCSI adapters. Why would you want to use
such an adapter? USB is much slower than SCSI, even the Falcon's SCSI
bus has higher transfer rates than USB 1.x.

You have the program in the same partition you're recording in? I have never done that. I don't trust it that much. If things go haywire during recording, you can lose of files! I always record on a completely different hard drive - an external SCSI. What hd software are you using? I have ICD Pro 6.5.5. It could be that Logic doesn't like certain drivers. Do you have the manual? Some people weren't able to get one before Emagic "ran out". Did you create a specific folder for the recodings? Try NOT putting any number in the file's name. Did you try standing on your head and reciting the Emagic/ Atari anti-problem chant? I seem to be running out of ideas. I'm pretty sure I had this problem (or at least something very similar) at one time, and the solution was simple. Aargh! Sorry I don't remember what it was.

The ACSI bus isn't very good for long cable lengths. You could try a
74F244 to buffer all the data and perhaps another for the A1, CS and so on.

Hi,

I recently purchased a falcon in a tower but it refuses to boot, the
floppy doesnt light up at all and the speaker beeps every second or so.
Since its in a tower its got lots of patches along with a 32MHzspeeder.
I get no picture at all when its switched on. It came with a 3.5"
IDEdrive that started screaming when i switched it on for the first time
so quickly disconnected it but still the same problem, no bootsequence at
all.
Does anybody know what could be wrong? Any advice?

Fredrik.

I am not an expert. That said, I have not seen any device that allows
the connection of an USB device to a SCSI port. The USB port requires
functionality that is not part of the SCSI standard, such as the ability
to hot swap.

Sounds like nobody fit power on delay to that chain.
(Maybee a problem while use PC PSU to power up an falcon mainboard)

Speaker beeping can be cut off by use an resistor patch on mainboard.

> Since its in a tower its got lots of patches along with a 32MHzspeeder.

32MHz CPU only Speeders are not realy stable.
Any falcon had his own timing thanks atari..

Maybee it CAN but nut must work fine.

> I get no picture at all when its switched on. It came with a 3.5"
> IDEdrive that started screaming when i switched it on for the first time

"Screaming" is an normal spin up noise or some else?

> so quickly disconnected it but still the same problem, no bootsequence at
> all.

First you should check power on reset.
Try the following simple trick:

Press reset button and hold it down. Press power on button. Leave reset
button after 5 Seconds. (Try it in a second time later)

If the machine comes up fine you can try to change two cap. on reset
circuit. Needs an solder iron.

Other way is to connect power good wire from PSU.
Needs solder iron also.

All what you need is descibed on DOITF030 FAQ.
Bad thing, itï¿½s all in german language. (most of)

Black screen after power on also says: rom/ram not found
But later, try first to play with the reset knob.

Regards, Robert

Hot swapping is not a problem with SCA SCSI drives. There are
workstations where you can add and remove SCSI peripherals when the
system is running. Even with the Atari you can do hot swapping if you
can ensure that you can prevent a short-circuit when removing or adding
a SCSI device. (This is easier with the SCA connector.) It is also not a
problem for most software based on the SCSI driver. Just make a bug
rescan after adding or removing a device.
Note that there are features supported by SCSI which are not supported
by USB.

>a floppy?

I have a Sony Mavica that I use with my Hades, so I really do not need the software to get the pictures, but there is a program I have called PhotoTip that will allow an Atari to pull images off of certain digital cameras. It is a super program. You can download the demo at:

http://home.sunrise.ch/dursoft/progs_e.html

Thanks for the tip - I haven't followed the link yet, but how would
the camera connect to the computer? Presumably a custom cable is
needed.

Thanks for that Uwe. Possibly the interest in USB is for using
ADSL, because at least here the BT adapters only offer a USB port.

DDP Translations are currently working on translating the ST-Guide hypertext
for this - it's a great program.

Other projects under way (I bet you wish that you hadn't asked ;-)

Calamus SL2000 manual (see "Tip of the Day" from a couple of issues of
"MyAtari" ago, Peter beavering away on this)

MagiC 6.20 upgrade text files and MagxDesk etc resource files

PixArt 4.52 - the resource and hypertext files are done, but the program
itself has much German embedded within :-(

Hi,
I have a fully-working Atari 520STe, No mouse, No monitor, TV Cable, and several games and programs for it on 720k discs.
What kind of price should I get when selling this??? I really don't have much of an idea.

Cheers,
William Sayers

You need a camera with a serial port. You connect the camera to the Atari using the serial cable supplied with the Camera. Olympus makes very nice cameras with serial ports and are supported by PhotoTip as well.

Joshua.

From what I've seen these tend to sell for a bit more from dealers than private sales, especially since they usually included the mouse with it. I got several of the old 520ST's for almost nothing a while back but the STe you have is a bit better cause of the newer OS Roms and the fact that the ram is simms. In my area an STe would go for $10 to $50 at the low end up to $150 (for a 4meg ste with 60meg hard disk, mono monitor, and a number of commercial programs in original condition). Judging from what I see some other things sell for I suspect the local prices where I live are skewed on the low side cause there are very few atari users and most of them are inactive.

Actually Mint or Debian 68k linux would be better choices than red hat
since very little porting of code would be required. Or just use it
with the stock os or neodesk & geneva.

Actually the thought of windows 2000 or any version of windows is a
really bad joke. Mostly because windows itself is perticularly abysmal
in all respects. Why anyone would be crazy enough to try to cripple
thier falcon with windows 2000 is laughable

>Ideas anyone? The drives are Panasonic JU253A11 720k ones.

I think this drive doesn't work with the ST. You will need to get a PC 720k
drive (1.44 drive will also do) and set the jumper to drive 0 instead of
drive 1 (PCs usually have their drive set to 1)
Amiga drives are different from PC drives because they have diskchange and
ready signals swapped and also there must be some difference in the ready
signal's timing.
I don't know much about the ST, but I know Amigas cannot use standard PC
drives, but I have heard Ataris can.

Unless you're really burning to buy a Mega STe, my advice would be not to bother with that offer. Check other online auctions like eBay and loot. He *says* the hard drive is quick to fix, but is it worth the risk? 50 odd UKP is a lot for a machine with trouble.

There is not a lot of difference between the STe Mega and standard. The case is a cosmetic difference, and the extra speed the other. It has more expansion slots, but getting hard now to buy something to put in them! The extra speed also means the vast majority of games will not work.

You can replace the hard drive for 10 or 20 UKP. The bottom line is , do you want an Atari with a hard drive? If so, put an offer in for nothing more than 50 UKP. There are whole working systems out there for sale which would be a better bargain.

Other people's ideas may differ :)

All :
x> I actually have a "super Atari" (sort of) when running MagiCMac on my
x> 40MHz 68040 Mac with hires colour and everything.
x> But a Mega STe would be nice...

I have both ! A Quadra800 and a MegaSTE 8^)

x> On the other hand, when I get my STe inside that 19" rack with all
x> those hardware add-ons it's really going to rock things!
x> I won't get the 16MHz speed of the Mega STe though.
x>
x> For those who have a Mega STe and have used it for a while -does the
x> 16MHz speed really make a difference?

Yes it does! After year with my first 520STM and then a MegaST it was a joy
to put my hands on the MegaSTE, 1.44FD, internal HD (and external SCSI with
special HA), separate keyboard, good design and faster, oh yes you feel all
the benefit of things going at double speed, and you still can play games
maybe switching back to 8MHz and/or disabling the cache.

It is my opinion but I have heard from many others too, that the MegaSTE was
the best made product Atari did at the time, and you have a nice keyboard and
all add-ons in the unit under the monitor, reducing all those
DMA/floppy/whatever cables around. It was nice with the "Caddy", that was the
44MB Syquest cartridges driver over the HD unit and other integrated
solutons, mine had a CrazyDots2 VME graphic card, now sold, and still has a
386SX ATOnce DOS card inside.

Wanna buy it ? 8^)

Ciao, ** *Mike* ** www.interware.it/users/mike/

: I've got a chance to buy a Mega STe, but unfortunately the seller is not
: "giving" it away as I was hoping for.

: I've had it on loan here for a while to check it out, and so far I've
: found out that the disk drive is mis-aligned (I believe it has to be
: replaced, but he says it can be re-aligned easily), it does NOT have an
: AJAX chip/HD disk drive (only 720Kb/DD),

For what little it is worth, the quick way to re-align a floppy is to lubricate the drive screw and ways. Anything else, if it works, may take days, and an alignment disk, and an oscilloscope. I have a Dysan disk from Best that runs on TOS 1.0 and 1.2, and not any higher version, and that does check alignment.

The AJAX chip is said to work at 32 MHz for 2.88 Meg formatting. The WD1772-02-02 works at 16 MHz for 1.44 Meg formatting. At least the ones I have used did.

>Thanks for that Uwe. Possibly the interest in USB is for using
>ADSL, because at least here the BT adapters only offer a USB port.

Actually, for me, the interest in USB is the fact that printers, cameras, scanners, etc. are increasingly available with USB connectivity, and increasingly ONLY with USB, such that our familiar serial and parallel ports won't work with new peripherals.

3499. New Release: MousMuso

Newsgroup: comp.sys.atari.st
Date: 2001-09-18 17:08:30 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0109180908.24400c60@posting.google.com>
Source record: 41969

Hi All

NEW RELEASE: MousMuso !!!

Saw a post on the CN-Fractal egrp (at Yahoo groups) from the author of MousMuso where he commented on one of my mids I created with his program for PC. He
mentioned there was an ST version. I mailed him and he released to me the ST version which he says is "better" then the PC version! Just not as colorful.

This is an alternate mouse controller with some real twists. Left and right clicks into the playing field produce completly different effects including hitting off arpegios and percussion. All sorts of things.

Works well on 030 machines too!

In the Zip is a a small manual in txt format which has all the key commands. Below is a portion of it which lets you know of the tremendous scope of this program as well enough info to get you started. I will be
creating a page for it soon, but it is now on the Atari-MIDI Archive file section. Have a look and download!! :-)I would invite comments.

http://groups.yahoo.com/group/atari-midi-archives/files/APPS/ALGO/mousemidi/

Tim Conrardy
http://tamw.atari-users.net

==========

In search of new music

Text document to accompany/explain MOUSMUSO.PRG and other HISOFT BASIC (tm) programs for the ATARI (tm) range of computers.

After 35 years of listening to music based on the standard harmonies of the west, my ear became jaded. Eastern music was attractive, with its unknown scales and unfamiliar harmonies of quarter tones but the desire to learn a new instrument such as the sitar was not there. Instead, the power and possibilities of the MIDI revolution beckoned.

With MIDI many instruments can be controlled - or should it be partially controlled ? at once. A power EXCEEDING that of

the orchestra is there, for instantaneous control. Hundreds - even thousands of instruments can be controlled with computer code - speeds unattainable by the fastest musicians - instruments responding in ways they were never designed to - sounds clashing and resonating in a way undreamed of by the classicists - because they are not HUMANLY possible.

All of the above are realisable with very simple code written for the ATARI computers. The programs that should be co-existent with this text [Please do NOT separate them] illustrates some of the possibilities listed above.

The Basic listings are available, along with explanatory text should you require it to let you adapt or write your own code - The aim of this effort is to promote more variety in musical form and randomisation certainly does that. However, these listings are extremely valuable to me and you need to write to me for details of this if you require source code.

Note that you may find the output of these programs

i) Revolting - How sad - too bad - throw them in the bin.
ii) Hard to take - listen for a bit longer, you may be surprised
iii) Exciting - Never heard stuff like this before ?

BASIC PLAYING HINTS to get you started

Note The Atari's intelligent keyboard buffer and repeat feature can cause problems and slow MousMuso's responses to commands. Try to avoid holding down a key, (unless you are attempting to use this as a performance control) as this may slow MousMuso down so much that it becomes unusable.

MousMuso plays notes over MIDI according to where the mouse is on the screen. Top left is the lowest note, and bottom right goes higher than MIDI allows. So you can jump 10 octaves+ (greater than a Steinway grand) with one flick of the mouse. Mousmuso shows you the note name and MIDI value on screen as you play individual notes. The mouse buttons have several different functions, but the most important is the RIGHT mouse button - this turns all notes off. The left button plays chords built on the mode that you are in, and with both buttons held it plays arpeggios (split chords) in the same way.

The number keys (keypad or others) set the current 'band' that is playing. This is dependant on your hardware, if you have one MIDI channel then that is your lot, but using the +/- keys you can set the number of channels to the number of instruments that you have.

MousMuso saves and loads 'bands' that is arrangements of up to 16 voices or MIDI program change commands. These are saved with a .MAR extender. Note that the particular 'bands' on the release disk are for the Roland Sound Canvas and may not suit the instrument that you own. To load and save bands use the 'L' and 'S' keys on the keyboard.

The function keys trigger different musical scales (more correctly named modes by musicians). Mousmuso generates ten random modes when you first run it. These may or may not be musically interesting, but it is more useful to start off by loading in a preset mode (.MMD file) from disk. See later.

MousMuso saves banks of modes of ten. Use the 'J' key and select MMBANK1.MBK from the file selector. This gives you ten different preset modes that I have either written in manually, or that were created by MousMuso and named by me. As a matter of interest, FLAMENCO.MMD was a random mode generated by MousMuso, as is PLANETS.MMD.

The Left Shift key lowers the DELAY value, the Right Shift raises it. The DELAY is the time between chord and arpeggio repeats. At zero, it is too fast for the human ear !

The CONTROL key bends notes UP according to the bend setting which is set with the 'D' and 'U' keys. The ALTERNATE key bends notes down. Note that the bend range is hardware and voice dependant. Most modules will be set to bend an octave or two and this is not useful. A better bend is obtained by setting the bend range of your instrument to 3-7 semi-tones according to the instrument that you are playing.

Mousmuso is easier to use than it is to explain, by hitting the <HELP> key whilst the program is running, then following it with the key that you wish help on. MousMuso explains or reminds you of its available options.

(NB You have to move the mouse at all times to ensure receipt of your commands.)

To quit from MousMuso just hit the spacebar.

That is all you need to know to get started.

Hi,

Please, can someone give me advice on how much approximately these Atari components are worth each:

Atari MegaST II with 2MB Ram inkluding keyboard and mouse
Atari Megafile 60 HD
Atari Megafile 30 HD
Atari SM124 Monitor

Thanks for any suggestions,

Overdoc

3503. CAB: Transaction failed

Newsgroup: comp.sys.atari.st

Some sites (not all) that have forms don't work - on submitting the form CAB just sits around on Waiting for Data and when it eventually times out or I press the ESC button, I get Transaction Failed.

Is this a known feature and can I get round it? Is it a CAB.OVL problem do you think?

Pondering why some sites are OK and some aren't - is it due to some forms being submitted via POST and others via GET?

3504. HDDriver and a STe

Newsgroup: comp.sys.atari.st
Date: 2001-09-18 17:47:22 UTC
From: ebaiz@skyenet.net
Message-ID: <KMLp7.141$Lb.36211@newsfeed.slurp.net>
Source record: 41974

Hello all,

I thought it was about time to install HDDriver on my STe since my ICD software was having trouble booting the STe's hard drive. Install HDDriver was a snap, but when it booted up I found that I could only get the four partitions read (C-F). The rest of the partitions (G-J) were gone eventhough I had not done a thing to them. Now the ICD software only recognizes C-F. It is really not big deal in that the data on those partitions were old and I do have 3 of the 4 partitions backed up. I was just wondering why this happened and if there is any way I can read the data on the missing partitions. The STe uses the Link II and I do have that option set in HDDriver.

Note that HDDRIVER (like any other fully AHDI compatible driver) will
only recognise 4 partitions if the drive was partitioned with quite old
ICD software. This old software did not create a partition layout
compatible with the standard AHDI layout.
What you can do is converting the ICD partition layout to the standard
layout with the ICD2AHDI software by Thomas Binder, which is in the
CONTRIB folder on the HDDRIVER driver disk.

the world for that matter.

Maybe it would be better if emotional outbursts from twisted perspectives
on such sensitive maters were directed to proper (other) newsgroups forums
or to personal corespondence, and out of a newsgroup dedicated to computers.

I do not remember such lamentations being posted here in 1999 when Yugoslavia
was destroyed for months BY AMERICAN TERRORISTS, and to make it worse, for
the large part in the noble cause of turning the public attention away
from Bill & Monica sex affair, and because of a personal hate of
M. Not-at-all-bright against the country which sheltered her for a couple
of years when she was a refugee from Nazi-occupied Czeskoslovakia.

Politicians say what they must, but one should be aware that for millions
of people over the world, in Vietnam, Cambodia, Iraq, Somalia, Yugoslavia,
etc. who have over the years been massacred without any real reason by
Americans, there is NO CAUSE FOR SORROW but many reasons for relief and
celebration that THERE IS some sort of heavenly justice after all, and that
United States, unfortunately the world's largest terrorist organization,
has finally got a taste of its own medicine on its own soil.

In 1999 Americans and their NATO arse-lickers celebrated themselves here
by many brave deeds, such as:

* poisoning of soil and air for centuries to come with radioactive dust
from uranium ammunition (number of cancers and children malformations
has already risen dramatically);

* destruction of a hospital in Belgrade (full of patients, of course,
it would not have been fun for the pilots otherwise);

* bombing (successful) of refugee convoys;

* destruction of a passenger train (full of passengers, of course);

* seeding of a marketplace full of people in the centre of the city of Nish
with anti-personnel cluster bombs;

* total destruction of a ortodox-christian graveyard in Prishtina;

* demoliton of country's electric-power grid (very few hospitals have diesel generators here and many people died);

* destruction of a business centre in Belgrade (a building almost identical to a World Trade Center tower in shape, but much smaller, the seat of some companies and several TV studios, and personnel in night shifts was there, of course, and were killed);

* destruction of the National Radio & TV building, complete with personnel;

* destruction of many TV-repeater towers, some of which were masterpieces of civil engineering and symbols of nearby cities;

* destruction of the Chinese embassy in Belgrade;

* exodus of more than 150000 inhabitants of Kosovo, and most of them will never return;

and many more deeds like that. And so, in three months of bombing, they have killed about 3000 civilians, but only about 300 soldiers, and destroyed several fighter aircraft and less than 10 tanks (estimate of military loss is by NATO). NATO entered Kosovo only after the emissaries had threatened our government with total, indiscriminate destruction of Belgrade. And AFTER the coming of NATO "peace troops" (i.e. occupation force) to Kosovo, more than 1000 non-Albanian inhabitants have disappeared there, killed or abducted BY ALBANIAN TERRORISTS OPENLY SUPPORTED ALL THE TIME BY USA (even against the wishes of their European allies, but since the Albanians have become the masters of narcotics trade in Europe, it seems that they have become sufficiently rich to buy many American politicians).

The world is "shocked" by the sight of WTC burning, but such a scene is familiar to us- the business centre in Belgrade, when it burned together with people who worked there, looked almost exactly alike. The ruin of Pentagon looks very similar to ruins of Government buildings which still lay in the main street of Belgrade. And the sight of desperate people showing pictures of their dearest ones is also very familiar to us- since the war many people with pictures like those have tried to get the attention of NATO officials and find something about those which the US-supported terrorists of the UCK abducted.

Had the tables been turned, NATO (i.e. American or British) officials would have shamelessly explained to you that the people killed in WTC were in fact "colateral damage of an attack on a legitimate target", that the attackers "love the American people very much", that the attacks were "for their own good" in order to "encourage them to remove their evil nondemocratic government", etc. All that is NATO vocabulary from 1999.

Anyway, especially after hearing, a couple of weeks ago, a distinguished American expert say that "America needs a war as soon as possible in order to pull its economy out of the coming recession", and seeing how the events have unfolded since then, there is a growing suspicion in the sane part of the world that the attacks on New York and Washington were designed and organized BY SOME AMERICAN AGENCY, possibly CIA (who else could have bypassed all the security measures so efficiently?), probably sponsored by

the military-industry lobby, acting through a bunch of muslim fanatics, for the purpose of getting the sympathy of the world and FOR GIVING THE MILITARY A FREE HAND for a while to do whatever they will in the world, with the bonus of giving a new momentum to weapons production and other branches of industry and business. Indeed, the US seem to be the only on who will get A LOT OF HARD CASH PROFIT from these incidents. Remember that World War II started when German soldiers, costumed in Polish uniforms, attacked THEIR OWN border post.

>Hope we can work together, call those that did it out, and work together to
>keep it from happening again. (And learn from this)

Indeed, learn from this, but those who -REALLY- caused it may not be those who at first sight appear to be suspects. Who lives by the sword will die by the sword. America could have been loved by the world. Instead, it chose to be feared. It will come to no good. If it lets the world be, the world will be a happier place.

I repeat, maybe it would be best to keep such sensitive matters out of a newsgroup dedicated to computers.

Regards;

The cameras that work with Phototip connect through a serial port. Now, there is a couple of people I know that use a SCSI card-reader. Email Lonny Purcell (atari@bright.net) and ask him about it. He is real proud of his setup....

I would think the Cab.ovl is part of the reason. I would email the URL address to Dan Ackerman. People have done this in the past and Dan has ajusted the ovl file so that it will work with the URL.

And this would be an Atari how?

Um, it would be a generic IBM compatible PC, running one of hundreds of alternative OS's. But if McEwen is calling zico an amiga, then I suppose a person can call a computer whatever they want. With that in mind, my p100 linux server is now "Cray".

>So, if I do buy that Mega STe I'll most likely have to buy a new drive
>as well, which will further drive (no pun intended) up the cost.

The cheapest option would be to just fit a new drive, get the seller to knock the price of one off, or get him to have the drive realigned professionally. I think you'd be ill-advised to pay the amount of money he's asking for a faulty machine!

If you have computer/electronic/radio fairs in your country you can often pick up drives for next-to-nothing. I paid 3UKP for a Sony drive for example.

An interesting postscript - I emailed Belkin about whether USB to SCSI adaptors existed (and they don't) and whether SCSI to USB adaptors can work in reverse (which they don't), and I was advised that the most efficient way to connect a USB device is to upgrade my OS to Win98 or MacOS, or install a PCMCIA card!

I replied saying that wasn't possible as my computer is neither a PC nor Mac, and got a reply asking what my computer was. I replied Atari Falcon, and back came the classic quote "It is not possible to upgrade game only electronic equipment to accept USB".

I did think of trying to email Belkin management about their quite ignorant sales staff! (Obviously who cannot tell the difference between a computer and a games console, and who do not recognise SCSI as a proper communication protocol).

I found Microtech's web site and the product in question, and it looks quite promising. I can't help but feeling though that buying a 'normal' digital camera plus either Phototip or one of these SCSI devices is a bit hit-and-miss (I've got no comeback on anyone if it doesn't work) so I might just end up playing safe with the Sony Mavica!

All other pages on the site work fine, so I'm not sure that is the problem. Although I very often get 'hanging' connections, e.g. image files, so I usually just press ESC and it carries on with the next one - maybe this is part of the same problem. It can't be the server - the same sites work instantly in work, so it's either my ISP (Zetnet) or CAB/STing.

3524. FS: Atari ST Keyboard Cover

Newsgroup: comp.sys.atari.st
Date: 2001-09-19 17:32:06 UTC
From: relayer@yahoo.com
Message-ID: <3ed2e411.0109190932.78c3fc6e@posting.google.com>
Source record: 41896

I have a keyboard cover for an Atari 520ST. It's brown leatherette vinyl, cut to wrap over the edges of the keyboard, and has stitching around the edges. Has the Atari logo in the center with 520ST COMPUTER written below it. I'm not in a position right now to buy a 520ST to put under it, so I'm offering it for sale for someone to put it on their 520ST. Make an offer. Shipping would be $2 to any continental US destination.

You can e-mail me at relayer --(at)-- yahoo.com or post on this group as a reply

Thanks

For adapters that enable you to connect USB devices to SCSI no special
drivers would be required. A decent adapter would ensure that the USB
device looks exactly like a SCSI device.

HDDRiver should be able to handle most/all SCSI drive devices.

In my other thread about digital cameras, the Microtech SCSI card
reader should also present itself to the computer as a hard drive.

PhotoTip works great with my Sony Mavica. I admit it is easier. Now
Sony has a Mavica that put pictures on a mini-CD which is almost like
using the ram cards of the other cameras.

Not everyone in the world is as twisted as this person.
Have a look at http://home.earthlink.net/~hankinhsd/thankyou.htm
for a truer picture of humanity.
My only reply to Vukovic is that I take extreme satisfaction in
his hatred, it means he lives a life full of self-loathing and will
be incapable of ever having true happiness. It is sad that anyone
should have been killed in Yugoslavia, but he seems to forget that
the groups in Yugoslavia killed hundreds of thousands more than
anyone else.

I would! And inform them that Atari actually produced more varieties of
computers than they did video game consoles.

What twisted perspectives are you talking about? Thousands of people died in one event. I think that's cause enough for comments here, as no doubt people here have connections one way or another. I personally know of someone who lost two relatives in this, one in a plane, the other in the WTC. By the way, it is the "World" Trade Center, not the "U.S." Trade Center. There were victims from 62 countries.

[snipped "emotional outbursts"]

As an American, having read your response, I will say that I am very sorry for the tragedies that have happened in your part of the world. The U.S. isn't perfect, has never been, and will never be. Even if our intentions were debatibly good, there have been times when events such as those you listed have taken place, and they were indeed horrible. However, every one of these events on your list were unfortunate times when something has gone wrong, and the destruction caused was unintentional. This event in New York and Washington was deliberately schemed for a number of years and carried out their intended purpose. It's truely aweful when something goes wrong and thousands of innocent people are killed. It's even worse when something goes as planned and thousands of innocent people are killed.

Let people give their condolances as they will. For example: My prayers go out to the families devastated by the mistakes made by the U.S. in eastern europe, the middle east, and anywhere these events have taken place.

3538. Need to read an Atari floppy on a PC

Newsgroup: comp.sys.atari.st
Date: 2001-09-20 04:43:17 UTC
From: Patti Wagen <pat.coffeyDELETEthis@DELETEhome.com>
Message-ID: <Fteq7.17171$6c5.527105@news1.rdc1.sdca.home.com>
Source record: 41910

I gave my Atari ST to a neighbor's kid and it is no longer available to me. I thought I had copied all the files to PC format first, but have misplaced the files. I have some files I need on an ST disk, but can't read them. I tried Norton to add the boot sector, and Norton hung. Does anyone know of a PC utility that writes the boot sector without destroying the data?

In uno strano messaggio del 19 Sep 01 x@x.xx (2:333/608.1) scrisse al povero
All :
x> Anyone selleing a Mega STe? And if yes, where in the world are you?

Yes I am in Italy.

x> Mail me with price and details if you have a Mega STe you'll let go to
x> someone who needs it :-)

I do not send you details as I think I'm too far from you, but maybe there
are other people near me so I put here a list of what I would like to give
away all together possibly:

- MegaSTE 4MB RAM keyboard mouse hard disk with serial fast ESCC
- monitor mono SM144
- extern Cumana floppy dual Drive with one 40/80 dual 5.25" and one 3.5" with
40/80 and A/B (B/C) switch, internal power supply
- dos/win emulator MSDOS Vortex AtOnce 386SX for MegaSTE with progonal
packaging
- dos emulator SuperCharger1MB on ACSI DMA port last software version, 8087
coprocessor, programming socumentation
- Mac emulator Macintosh Spectre GCR original packaging
- hand scanner Alpha Data on cartridge port with Touch-Up software original
packaging
- SCSI host adapter board for MegaSTE "Das Vorbild" allows all SCSI units on
the chain with software SCSITools, original packaging
- various original software (Diamond Backup/Edge, Werks, Warp9, etc.)
- SupraDrive 44 removable extern 44MB cartridges drive with 10 cartridges,
connects to ACSI DMA, has an internal host adapter for internal SyQuest SCSI
drive, external 25pin SCSI port, SCSI ID selector
-cables connectors to connect to monitors with switch to multisync or SCART
(Euro/TV), DMA, spare mouse etc.

Maybe somebody in Austria, Slovenia, Hroatia is interested to pick up all the
stuff for reasonable money ? I accept offers to swap with other Mac/PC
hardware.

> >Those sites may be slow at this time or have a server that is down.
>
> All other pages on the site work fine, so I'm not sure that is the
> problem.

What I meant is that I have sometimes problems like yours: cab waiting
for an action (post or get) to give its result. If I hit ESC at that
time, it's normal that the transaction fails.

An example:

- I load an html page with images and a form -> no problem, quick answer
from the HTTP server.

- Then I fill the form and it is sent to a PHP server (same ISP) -> the
PHP server is overloaded at this time and cab waits until the
transaction fails, either by timeout or the ESC key.

Bye,
/Pascal/

>devices is a bit hit-and-miss (I've got no comeback on anyone if it

There's a write-up of this very system in an Atari Computing mag IIRC - it works very well, HDDriver recognizes the memory card when plugged into the adaptor and you drag files to-and-fro just like any drive.

>doesn't work) so I might just end up playing safe with the Sony
>Mavica!

Don't forget that you have to wait whilst the camera saves the image to the floppy, no chance of taking another "quick" shot. I wonder too how long the batteries last?

I'd go for the PhotoTip option myself, and the good news is that it is still being developed. It's got some nice features that aren't camera-related as well.

My ancient 1040ST is failing. I'd like to have a few more for when this one dies. I have already ordered one from a guy who read a previous message here from me. And I just emailed one guy offering some Ataris a few weeks ago.

But I'd like a few more. I'm also seeking the black and white monitor.

By the way, the problem I'm having with my system is that often the built in floppy doesn't work. I think it will fail soon. Are they replaceable? Does anyone have a drive they can sell me that will work?

Hmm, but a PHP server is no different from the HTTP server - it's
simply a command interpreter running on the same machine. And the old
site running on the same machine works OK. Odd problem.

There used to be two IBM programs which would let you access the data
on an Atari floppy disk without writing ANYTHING to the disk (which in
my opinion would be the safest way to deal with an irreplaceable
disk).

I haven't seen a source for these programs in a long, long time, but
they might show up on an FTP search engine (I haven't had time to look
for them myself, unfortunately).

Look for either ST2PC.EXE or STTOPC.EXE

The programs will READ the files from an Atari formatted floppy and
let you COPY the files onto an IBM disk drive without actually
changing the boot sector on the Atari floppy.

Good Luck!

BobR

I find writing songs a bit tasteless before even the rubble has been removed
and the final toll counted

3560. Megafile30 driver

Newsgroup: comp.sys.atari.st
Date: 2001-09-21 00:52:03 UTC
From: mark richardson <markbcrich@hotmail.com>
Message-ID: <Tawq7.364929$TM5.54919581@typhoon.southeast.rr.com>
Source record: 41930

Could someone please post or email me or tell me where to find a driver for
an Atari Megafile30 harddrive.
I bought one at a pawn shop. They didn't include any software. I have been
looking everywhere online for a driver
or something to bring it to life. My email is markbcrich@hotmail.com, if
someone could sent me in the right direction.

Thanks,
Mark

Wasn't that an aftermarket supplier for the Timex/Sinclair computers?
I would try the comp.sys.sinclair newsgroup or even the comp.sys.cbm group
if you don't mind starting another computer war. 8-)

3562. Metal Bird MP3

Newsgroup: comp.sys.atari.st
Date: 2001-09-21 04:12:32 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0109202012.dbf70e4@posting.google.com>
Source record: 41932

Hello All

Go to:
http://kalvos.org/tragedy.html

and look for METAL BIRD. MP3

This piece is based on the events of Sept 11th on the Attach of the World Trade Center and Pentagon in the USA. It starts out a sunny day in new York City and then the first plane hits initiating the following tragic Events of the day with audio clips from the actual events (taken from the Internet).

Technical Note: this piece was created using numerous algorithmic Music programs on Atari Computers (including "Music Mouse" by Laurie Spiegel) along with live playing of the instruments and recorded to WAVE using Sound Forge on a PC and then converted to MP3. The actual music was composed the day after the incident (9-12-01) and the audio clips added later. Working in completing the piece was an emotional experience as if I was reliving the events as they happened.

Tim

That's impossible because you cannot install a hard disk driver on a
hard disk that is not properly connected. You would not be able to write
the driver file to the drive in this case.

There is no specific driver for a Megafile 30... Any hard disk driver will handle it. Mine is running with AHDI 5.00 (yes, that's old :-) but this is probably one of the slowest driver that exist on Atari...

Actually when I bought my second hand Stacy many yeras ago the floppy
drive head was misaligned. It could only read floppies written by itself.

To align the read/write head was very simple! I just used two wooden
tothpicks and straightend the membranes that keep the head in place.
Since then this is the best floppydrive I have. Maybe I was lucky but the
naked eye can be a very senisitive measuring tool.

3567. MiNTnet questions

Newsgroup: comp.sys.atari.st
Date: 2001-09-21 12:09:59 UTC
From: nospamplease@zonnet.nl
Message-ID: <r6Gq7.15638$2z4.55711@zonnet-reader-1>
Source record: 41938
Body handling: HTML body converted to readable text

I have installed MiNTnet (thanks to MiNTnet for Dummies III) and have begun setting up a Sparemint system. I'm already having lots of fun with it but also several (beginners?) problems. If anyone wants to react to one or more of the following questions/problems please do.

1. When booting, a message appears that looks a bit like this:
WARNING: mounting unchecked filesystem. Running fsck is red....(end of screen)
Is this something to worry about, and how can I get rid of this message safely ?

2. a) When dialing with PPPD I get this message:
/pipe/log: No such file or directory
b) After that connection to my ISP is succesfull, but I would like to see more info and confirmation on my screen. I know there is a verbose option, but when I put
connect "/usr/sbin/chat -fv /etc/ppp/pppchat.myprovider " in my options file
I'm getting no connection at all. With -f (without v) everything is OK, but
I'm not getting any connection info then.
c) When my connection to my ISP is broken unexpectedly (happens especially during "prime time") I can't dial again using the pppd command, I can't kill pppd's pid, and I have to reboot before being able to make a new connection. There must be an easier way ?

3. Problems with lynx 2.8.1-2 When I hit to download a link I see
Unable to access document.
I expect to see a "download options" to "save to disk", but this doesn't show up.
Then I quitted lynx to take a look at my harddisk contents:
When I look into my /tmp directory 2 new files are there with names like
L18-1TMP.zip and L18-2TMP.html (the downloaded file was a zip file).
The first one is the file I tried to download, but with a new cryptical name.
The second file is a html file containing the "download options" and "save to disk" and the original and suggested filename for the file to download. But I never saw this html appearing on my lynx screen.

Also with and
I only see "Unable to access document".
No options settings. No print options. Why are and
not working for me ?

Besides that: I love lynx. It's probably faster than CAB in text-only mode. In all the discussions about browsers for Atari one should not forget this powerful text-only browser.

4. These lines in the mint.cnf file
exec u:\bin\sh u:\etc\rc.net
exec u:\bin\sh u:\etc\rc.local
crash my system during bootup when I'm running (or trying to run) in protect mode:
MEMORY VIOLATION: type=`. RW=r AA=61FFFFFD PC=1F6732 BP=1C46C0

When using mintnp.prg, everything is OK.

5. Can MiNT handle longer filenames than THiNG can? I downloaded a file that caused THiNG to
come up with an ALERT that my partition contained filenames that were too long, but I couldn't
get rid of it from the desktop, and the ALERT kept appearing again and again.
But then I learnt how to use commands like ls, and mv.
From the bash I could do things that were impossible on the THiNG desktop. I found that very
long filename and renamed it to a simpler one. Problem solved.

6. My last question (for now ;).
I'm using rpm to install the packages from the Sparemint archives. When I run rpm from the bash with something like
rpm -ivh somepackage.rpm
I'm getting an "Illegal instruction" message, and the package is not installed.
But when I use
rpm -iv somepackage.rpm
the package is installed correctly. This is not normal, is it ?

I hope I will get some useful answers. And yes, I did read the docs coming with MfD and MiNT
and the rpm packages. But there are a lots of docs, and I don't understand everything of it.
Every help is welcome.

My system: Falcon030, 14MB, MiNT 1.15.12, N.AES 1.2 (Soon to be 2.0), THiNG 1.27

3568. FS: Atari STf (2.5 meg memory) with Notator

Newsgroup: comp.sys.atari.st
Date: 2001-09-21 13:56:42 UTC
From: Jon Pruitt <jpruitt@earthlink.net>
Message-ID: <3BAB4552.AEE7D339@earthlink.net>
Source record: 41940
Body handling: Binary attachment payload not displayed: jpruitt.vcf

This system has not been in use since 1996. It needs a home so it doesn't go in the trash. It all worked great at last use.

I have for sale: an Atari 1040STe with 2.5 megs upgraded memory, a mono monitor (SM124)
a panasonic dot matrix printer, (24 pin KX 1124) and a copy of C-Lab Notator , with Unitor and Export interfaces. This system always played back solid midi timing, which is more than I can say for the more modern computers I use now. There is possibly some other music software, if I can dig it out of storage.

Ideally, I would like to find someone who would use and appreciate the Notator/Unitor/Export combo, but mainly, I just have a problem with seeing this stuff go into a landfill. I had hoped to find a young person who would use it in a midi studio, but I think technology has changed so much that few people would have that kind of setup now.

No reasonable offer will be refused. I am located in Southern New Jersey, USA , for shipping calculations. If you don't want the printer, np.

Jon Pruitt

That's because you haven't shutdown the system properly. When this
happens the system checks the available minix or ext2fs partitions. BTW:
what fs are you using? IMHO, ext2fs is far better then minix.
You can get rid of it by close down the system properly. AFAIK, the only app
that does that job good is Draco's shutdown.app.
http://wh58-508.st.uni-magdeburg.de/~draco/falcon.html

>
>2. a) When dialing with PPPD I get this message:
> /pipe/log: No such file or directory

That's because syslogd isn't running. Not quite sure about it but I
think you can start up syslogd automatically at boottime by adding a
line like this in /etc/std.services
syslogd /usr/etc/syslogd. The configuratiojn file for syslogd is
/etc/syslog.conf

> b) After that connection to my ISP is succesfull, but I would like to see more info

That's probably because syslogd isn't running. No syslogd no logging

> c) When my connection to my ISP is broken unexpectedly (happens especially during

Hmm, this rings a bell to me but right now I can't recall me how I've
solved this. Can't you kill pppd. ps. There are a few nice GEM
interfaces available for pppd, connexion (Jo-Even Skarsteen) and Mico
(Marc-Anton Kehr). I believe the problem went aways as soon as I started
to use Mico.
>

>3. Problems with lynx 2.8.1-2

Can't help you with Lynx. Lynx works just great on my machine. Maybe a
setup problem? Take a look in /etc/lynx.cnf
>
>4. These lines in the mint.cnf file

Can't help you with this either. I don't start rc.net and rc.local from
mint.cnf. I believe (not sure, I'm not a MiNT-guru) these things are
execute by rc which is execute from init on my setup.

> When using mintnp.prg, everything is OK.

I don't use Memory protection because some (old)programs I use daily doesn't
like very much MP.

The latest version of Thing can handle much longer filenames. The author
of Thing will surely release Thing 1.30 but he hasn't said when. This
can happen tomorrow but also next year. :-(

I sould say no because the -h options serves only to display the
proceeding of the installation by means of hash-marks.
Anyway I always use -Uvh and so far I didn't encounter any problem. IMHO
-U is a better way to install rpm's then -i but I can be wrong ofcoruse.

BTW: there's a very good doc about rpm on the Net:
http://www.rpm.org/max-rpm/s1-rpm-install-handy-options.html

How much are you looking to get. Id only want the system cause I have
a sm124 and a printer already. This would go perfect into my
semi-studio/attic. My 1mb 520st needs more ram. Im 20 also so I fit
your young musical person.

With all these 'can you help me find?' questions i feel it would be nice if peeps told us at least which continent they are on.

I did spot some stuff at a shop in London with a web site.

Here is the URL:-
http://members.aol.com/retrox2/index1.html

It may not be listed on the site.

: I think this drive doesn't work with the ST. You will need to get a PC 720k
: drive (1.44 drive will also do) and set the jumper to drive 0 instead of
: drive 1 (PCs usually have their drive set to 1)
: Amiga drives are different from PC drives because they have diskchange and
: ready signals swapped and also there must be some difference in the ready
: signal's timing.
: I don't know much about the ST, but I know Amigas cannot use standard PC
: drives, but I have heard Ataris can.

Not entirely true. The Amiga is just a bit picky with its drives, it won't
take any PC garbage, but a sufficient amount of PC drives will work, after
being subjected to the unit selection mods often required on the Atari as
well. But since there is a likelihood that you might fail on the first
attempt, most people won't believe that PC drives will work on Amigas.
I don't think Ataris are quite as picky, though. After all, they use the
same format and encoding as the PC.

Hypocrisy is in full flight these days. I get the impresion that you did not read carefully or through the end what I have said, so I will recapitulate my points. After that I hope I will stay silent on this matter. Hallvard has spoken wisely that politics should be kept out of this newsgroup, and that is what I urged too. I was accused of hate here just because I pointed out some unpleasant facts. So:

a) Of course it is horrible when innocent civilians die. But it is not decent to pass it silently when US government does the killing for years, and then to broadcast being in a shock when somebody finally retaliates. Yet, lives of 5000 Americans are not worth a cent more than lives of 5000 people from some other part of the world.

b) America supports and performs terrorism in other parts of the world whenever it is convenient. The current suspect, Bin Laddin (or however his name is spelled), was an American protegee not long ago. He was issued a Bosnian passport by the muslim+croatian faction which US supported. In Kosovo his mujahedins fought side by side with NATO and the Albanian terrorists of the UCK and the UCK is still supported very much by the US, even though the President of the US himslef called UCK "a terrorist organization" not long before. But there is NO GOOD AND BAD TERRORISM.

c) Yugoslavia suffers from UCK terrorism for years. Yet, when it tried to dispose of the terrorists like US is planning to do now, there were cries of human rights and Americans quickly jumped in to help their friends.

d) Main source of income of the US-supported UCK terrorists is illegal narcotics trade.

e) NATO killings in Yugoslavia were crimes of the same nature like the recent incidents, and should be punished. And American government is quite aware what it is doing all the time, and is fighting in any way imaginable against the possibility that Americans be brought to answer to future UN's international court for war crimes.

f) When someone has been horribly hurt it is natural to expect that he would like to see revenge upon the wrong-doer. Media showed some people celebrating what happened to the US, but did not bother to show many more in other parts of the world. That is not my idea, I merely pointed out the fact. And do you think that relatives of the people who lost their lives in WTC would be sorry to see thousands die when US annihilates Afghanistan a couple of weeks from now.

g) Average person does not know much about the circumstances in some backward part of the world such as e.g. Yugoslavia. He is easily manipulated by the media, and little inclined to think. But history of the world is not a collection of CNN broadcasts.

h) America is starting a crusade against Afghanistan before any decent investigation is finished, just because it is a conveniently weak target in a strategically important location, and it doesn't matter if people there are really guilty of the incident. It would not be surprising if US army were looking forward to finally testing all those fine nuclear weapons in a spot conveniently far from home. Anyway, it is sure to start a new circle of violence.

i) Possibility should not be ruled out that the recent incidents were directed by some American agency, in order to provoke precisely what is happening now. Again, this is not my idea. AFAIK even some Americans are beginning to wonder.

j) Anyway, US government is responsible for the recent incidents more than anyone else, because of the way it acts around the world.

k) Undoubtedly, there are many fine people in the US, as well as in other parts of the world, but they let too many lunatics take to power.

Regards;

Hopefully we will calm down and speak of computers here.

is there a reason one shouldn't just format high density floppy disks as
double density?

this is what I used to do, but it always presented a problem if you wanted
to read them in a highdensity drive..

I sell nearly new ex ST magazine cover floppies, 10 for £2 plus post.

Minimum order is £10.

Most have only been read to expand the software to another floppy.

I'm not so sure it would be that different. On most PC's I seem
to think they only spend 5% of their booted up time doing any
useful work...the rest is spent loading software or thrashing
the swap file!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Is this something to worry about, and how can I get rid of this message safely ?
The filesystem has to be checked, in freemint-1.15.5 archive is a
documentation how to do this at startup.

> connect "/usr/sbin/chat -fv /etc/ppp/pppchat.myprovider " in my options file
This is wrong it should look like this:

connect "/usr/sbin/chat -f /etc/ppp/pppchat.myprovider -v ....

> c) When my connection to my ISP is broken unexpectedly (happens especially during
> "prime time") I can't dial again using the pppd command, I can't kill pppd's pid,
Look in /proc or with command ps, if chat is already running, if so kill
this.

> crash my system during bootup when I'm running (or trying to run) in protect mode:
> MEMORY VIOLATION: type=`. RW=r AA=61FFFFFD PC=1F6732 BP=1C46C0
You will find many docu about memory protection in freemint-1.15.5
archive.

> the package is installed correctly. This is not normal, is it ?
No, this isnï¿½t normal, perhaps you have to reinstall rpm, but beware
that your data of installed packages will be lost! Make a backup of
/var/lib/rpm before doing this.

Ciao

Some time ago it was mentioned that it might be possible to use a
memory-card/floppy disk adaptor but that possibly a dedicated program
would be needed to read such a "disk". Has anybody had any luck with
that approach? I suppose that id a PC floppy drive can read such
a device, an Atari can do at least as good.

I succeeded in aligning a floppy drive too, but I would not want to repeat
the experience. Long time ago I bought a second-hand HD floppy drive for a
replacement in my computer. It needed a thorough cleaning, and so
I removed he PCB from the mechanism to have better access- but it turned
that sensor for initial head position was on the board, so when I
reassembled it, it didn't work properly. However, the PCB had provision
for sliding in its seat a couple of millimetres, and by using a
"known good" floppy with some files on it I found an approximate
position where it worked. Then I moved the PCB to one side and then to
another side clearance, to determine the positions where it would start
reporting errors. I accepted a position in the middle of those two
as the correct one and secured the PCB in place. Indeed, it has worked
since correctly. However, this achievement was done in desperation
and I would not recommend such a feat.

Cu.

HD disks will probably not be reliable on a DD drive. There is a
difference in the media. You should try to get genuine DD disks if
possible.
```

A friend of mine has one for his camera, but it requires software. I
plugged the floppy into my Falcon and IIRC the floppy drive window
would open but it didn't show any files.

Have you tried running a ST emulator on the PC and then trying to
access the disk. The other option is to send the disk out to a person
who has an Atari and let him/her email the data back to you.

And once you've finished blowing them up you'll be able to sell them some
state of the art weapons systems!!!.

You'd better drop a nuke in your own back yard as thanks for all the support
you yanks have given to the IRA, for them to be able to blow up myself and
my neighbours in London docklands and Woolwich.

I spent years as a 'legitimate' target as I worked to assist the forces, it
was a most comfortable lifestyle, thanks to all you IRA supporters over
there.

Come to think of it I've never actually been told that I'm off the official
legitimate target list, so thanks again.

Why don't you shove your head back up your arse!!.

P.S. I totally condemn the actions of the so far unknown terrorists for the
cowardly and unnecessary attacks on New York and elsewhere.

A very good reason, the only thing they have in common is the plastic case
dimensions, otherwise they are chalk and cheese.

You'd probably make more money selling them as cover disk's, some people collect them like heirlooms.

3594. Restoring the mouse pointer?

Newsgroup: comp.sys.atari.st
Date: 2001-09-22 23:20:02 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3bad1ca2$0$4907@news.zetnet.co.uk>
Source record: 41866

Hi all!

Does anyone know of a program that when run, will restore the mouse pointer?

Whilst online just now, I had a crash which made the mouse pointer disappear. I had to reboot, losing my connection and a download that was happening!! :((

This happens occasionally and it would be useful to have a program to restore it when run from a function key in Jinnee. (I'm using MagiC 6 btw so it has to work with that).

Cheers!

James

Personally, I would hope Americans first figure out _who_ the bastard(s)
are and then present the evidence to the UN, out in plain view, before
they attack anyone. Otherwise, Americans are just as guilty as sin and
deserve nobody's support.

Funny how Americans say they beleive in God and pray so much, yet ignore
Jesus' warning that the old jewish "an eye for an eye" is not the right
way to do things.

To: us@seimet.de (Uwe Seimet)
From: dwolfe@netcentraltv.com (Don Wolfe)
Organization:
Subject: HDriver 4.52
X-Mailer: NEWSie Version 0.96 (Atari)

Hi Uwe,

I'm having a boot problem. I decided to write protect the boot sector
of drive C: so I clicked protect boot sector and clicked on the box for
drive C: and clicked OK, all seemed fine till I tried to reboot and get
the message that drive C: is write protected (Abort-Retry-Ignore)
after using Ignore about a 12 or more times I finally got through the
boot proccess....

So I figured I better open HD-Utility and remove this write protection,
but the program won't let me remove it, it says drive C: is write
protected... So what am I doing wrong ?????? Please advise !!

Thanks for any Help, Donner.....

Your message on the subject

"HDriver 4.52"

has been delivered successfully. However, I'm not in the office
for some days, so I don't have read your message yet.
What you read is an automatic response, which you will get only
once.

Best regards, Uwe Seimet

To All,

Excuse if this is a double Post, don't think the first one posted.

What is the right way to get rid-of this write protection ?? Delete
the driver from the root directory of drive C: ??

Thanks, Donner......

>
>this is what I used to do, but it always presented a problem if you wanted
>to read them in a highdensity drive..

Just stick a piece of opaque tape over the left-hand hole and any HD drive should be able to read them as DD. But there are other reasons why using HD disks in DD drives is not a very good idea: The magnetic coating of HDs has a higher coercivity than DDS to give higher packing densities. This needs extra write current in the heads. Many DD drives are too weak to give *reliable* writing on HD disks.

I have also heard it said that HD disks written in DD drives go faulty quicker with time, though I can't see a reason for that and it may be an old wive's tale. OTOH if the magentization is only just strong enough to give correct reading when new, a slight loss of magnetization with time due to wear of the coating or self-demagnetization could have that effect.

The best thing is to get an HD drive and the required harware circuit fitted! :-)

Regards, /Peter/

3600. TAMW banner and AEX

Hi All

Dr Ambient (of the Atari-MIDI mailing list) has redone his site (very nice) and informed me
he has a page devoted to his new project called AEX:An instant Tangerine
Dream machine for Atari computers. There is a nice screen shot and details
about the program.It is not available yet, but he is working DAY nad NIGHT
to complete it for us (right DR.?)

Also, he has created a TAMW (Tims Atari MIDI World) banner for all and sundry to use on thier own sites (if desired)Actually, I look at it not to
"inflate" my head, but to tell others about the wonderful Atari-MIDI programs now available. Please feel free to pass this banner around and get
more coverage and usage on these great apps. (and to pay the shareware fees!
:-)

Just follow the ATARI link when you get to the DR's Site.

Check out his other pages there as well.

here is the DR's SIG with all the revelant info:

Dr. Ambient - /|\ Falcon030/TT/STFM - AMD Duron 700
Homepage: http://members.ams.chello.nl/g.goebertus (under construction)
Soundfonts: http://www.drambient.f2s.com
Music: http://artists.mp3s.com/artists/233/dr_ambient.html

Project: AEX: An instant Tangerine Dream machine for Atari computers

THANKS DR! Everyone repeat after me:

> I find writing songs a bit tasteless before even the rubble has been removed
> and the final toll counted

I see it as a way a musicain can get out his emotions and inspirations
OUT and not keep it bottled up inside. It is things like this that
sometimes drives artists to create thier greatest works.

For instance it was real hard for me to create my Piece METAL BIRD..as
I was reliving the events, especially when I was putting together the
audio clips that went with it. But it was an outlet for me , and I
feel much better. I was able to go thru those emotions without keeping
them inside. The piece as it turned out is very powerful and
frightening at the same time. A reminder and a tribute .

So you have software installed that tries to write on C: during the boot process.

> So I figured I better open HD-Utility and remove this write protection,
> but the program won't let me remove it, it says drive C: is write
> protected... So what am I doing wrong ?????? Please advise !!

You should first disable the write protection with the HDDRCONF.CPX, as the settings made by HDDRUTIL do not get valid before rebooting. Please also refer to the manual for details.

Yes MOUSEON.PRG (only 858 bytes) does that. I have installed it on
a key combination in Thing - should be able to do the same in
jinnee. I'll pass it on to you Wednesday at CCC if you remind me,
or I can mail it.

Disagree.

From customers' experience.

If all your data is stored on HD disks and your machine fails, you can't get
at your data until you get it fixed or borrow another HD equipped machine.

Stick to DSDD floppies and make backups.

Barrie at Keychange.

If you are worried about compatibility with non-HD equipped Ataris, use
a HD drive to format a HD disk to 720K. The HD drive will be able to
fully magnetise the HD disk, and if it is formatted to 720K, it should
be readable by DSDD drives.

To me this would be a non-issue. None of my friends still use an Atari,
so if my machine fails, I would either have to get it fixed or use a PC
to access the data (which would be able to read HD disks).

By the way, don't rely on floppy disks for long term storage. Most of my
old Atari disks are no longer readable.

Martin

That's basically correct but the settings made by HDDRUTIL are permanent
settings and will be activated after a reboot. The settings made by
HDDRCONF take effect immediately, but are not preserved after a reboot.

3616. Cameras, SmartMedia, and your Atari

Newsgroup: comp.sys.atari.st
Date: 2001-09-24 13:57:56 UTC
From: Lonny Pursell <syntax.error@line.22>
Message-ID: <Pine.MNT.4.31.0109240938340.106-100000@Hades060>
Source record: 41891

Some time ago I asked about card readers and such and someone
suggested Microtech. I got a camera that allowed serial transfers
but found it annoying, and mostly slow. I found a SCSI Microtech
PC card reader (dual PCMCIA slots) bought a SmartMedia adapter
and hooked this up to my Hades060. It works with 2 minor glitches.
You have to force a media change to get the system to access the
card correctly. If the card is over 32mb then you need something
like bigdos installed to access it.

I thought I'd follow up on my findings. No more serial transfers for
me, and PhotoTip is completely uneeded. Since the SCSI device treats
the cards as harddrives, you just open them like drives and drag
the images off. Nice and fast.

btw, you can get CompactFlash and Sony Memory stick adapters
so this opens up some more possibilites.

If anyone wants further info, keep in mind I only post here.
Contact me at my private mailbox.

Hi all,

You would have probably noticed, if you're a fan of Persistence Of Vision
(POV), that POV 3.5 has been released. It's released but source code has
not been yet. It means that POV 3.5 is binary relased for Macintosh and
PC platforms, under beta 4. The largest modification relies on the integration
of a big extension of POV called MegaPOV. You would probably know that POV
3.1g is available from my homepage. POV 3.5 sources will take a long time
to be released. Meanwhile I suggest that you download the binaries of
MegaPOV 0.7 on my piece of WEB. Because MegaPOV is an extension of POV 3.1g,
if you download MegaPOV, you would require also the corresponding archive
of POV 3.1g. The MegaPOV archive contains principally the executable, besides
from the documentation and examples. The MegaPOV executable (POV3.TTP) will
just replace the 3.1g. There will remain the includes, scenes, the
configuration etc ...

You must know that if nothing is declared in the POV script, MegaPOV will
exactly behave like POV 3.1g. You must add :

#version unofficial MegaPov 0.7;

to the script, so that MegaPOV will be taken into account, with all the
extensions.

MegaPOV is an unofficial extension of POV3.1g, but this extension has
been integrated by the POVTeam. So MegaPOV 0.7 is temporary, waiting for
the release of POV 3.5 sources. If you want to have more information about
POV 3.5, there's a beta documentation online at :

http://www.povray.org/working-docs/

and a preview at :

http://povray.co.uk/povray3-5beta-p01.asp

POV 3.5 is partially compatible with MegaPOV 0.7. That's why you must be
aware that your MegaPOV scripts may be partially unportable to POV 3.5.

The
difference is a tiny change in the syntax. MegaPOV has been used by the
POVTeam to produce a new version of POV. But you may want to wait for
3.5
version. I must bring to your attention that the GIF image format is not
supported anymore. You will need to translate from GIF to PiNG (PNG)
image
format, that is equivalent, unless problems of Intellectual Property of
GIF.
MegaPOV is an interesting extension of POV 3.1g (the latest stable
release of POV).

Finally, I will tell you to enjoy POVing ...

See you soon for new news of ATARI front ...

Best regards,

Steve Sweet <stevesweet@freeuk.com> writes:

: Hi Oracle

: > is there a reason one shouldn't just format high density floppy disks as
: > double density?

: A very good reason, the only thing they have in common is the plastic case
: dimensions, otherwise they are chalk and cheese.

My experience differs. 10% difference in coercivity is not much, to me,
and I make an extra hole when I want a bigger disk, and tape it over
when I want a smaller disk. So far, 1985 to now, has not created
problems I have noticed.

Huh? I hope this was just a joke. Anyone still considering "an eye for an eye" to be a proper christian solution must be ignoring the New Testament completely or misinterpreting it on pupose. Be it individuals or nations.

Request the UPS tracking number. UPS have a web site where you can
enter any tracking number from anywhere in the world and confirm the
date and time of arrival at every stage along the way.

UPS have a tracking number for every shipment (millions per day) and
every single one of them I've ever chased are updated to the website
within minutes of them being signed for (an exceptional system) IMO).

Try them at http://www.ups.com

3623. FS Mega ST accelerator 50MHz 68030 + FPU + 4M (UK)

Newsgroup: comp.sys.atari.st
Date: 2001-09-24 20:24:36 UTC
From: ian <ian@dotqr.com>
Message-ID: <1001363143.10840.0.nnrp-01.9e98e6ee@news.demon.co.uk>
Source record: 41894

My collection of accelerated Atari gear needs thinning
so here goes:-

FAST Technology Mega ST accelerator
===========================

Atari Mega ST accelerator. Includes a 68030
running at 50MHz and a 6882RC50 FPU unit. There
is 4M of Fast TT 32 bit RAM, and TOS 2.06 fitted
on board (replaces ST TOS).

Also included on board is a 68000. A flying lead
to a SPST switch lets you boot in 68000 compatible
mode or with the 68030. A plug suitable for the
spare PSU connector on a Mega ST is included.

Suffice it to say this will produce a dramatic
effect on the speed of your Mega!

WARNING
=======

Requires the 68000 to be removed and a socket fitted
(included). The board then plugs into the socket and
there is a lead for the Mega ST PSU. You will need to
be sufficently competent to do this. Note this board
does not use the extender socket often used for graphics
cards in a Mega ST, this remains free. The card also
includes a spare PSU socket.

Various disks were included with the software, but no
printed docs. The unit was working when last used, but
is sold as seen.

Cheers

Ian.

> So which is the best program to set the fastload bit in a program
> and a driver?

Two programs come to mind, John:

GD-FLAG v1.13 by Gregor Duchalski (English translation by Joe Connor)
Makefast v1.7 by Thomas Much (German only)

Makefast allows you to not only set the Fastload bit, but also to
specify how much RAM to clear for the program - from 128Kb to 2Mb.

GD-Flag has additional features for use with MultiTOS.
From the docs...

==========
GD-FLAG Program Description...
This program provides an easy and convienent method of editing program
Headers. Ideal for TT and MultiTOS users although most Atari users
should find GD-Flag a handy utility to have around.
TT users can use GD-Flag to determine which applications load into TT
RAM and for awkward applications which frequently need to be switched
between ST and TT RAM GD-Flag is indispensable.
MultiTOS users can set the Global, Private, Super and Readable options
covered in detail in the MultiTOS documentation.

Everything takes place from an extended File Selector dialog screen.
Select the desired file and edit its header using the desired options.
Select the 'Set' button to overwrite the header and select 'End' to
quit GD-Flag.

Very Brief Overview of features, refer to the MultiTOS, TT or third
party documentation for more details:

- Fastload: Programs run without the Fastload bit cause TOS to clear
all free memory (from the beginning of the program to the end of the
TPA (Transient Program Area). This is slow and in most cases
unneccessary. With the introduction of TOS V1.04 a fastload option

was added, the fastload routine only clears enough memory to enable the program to run (the BSS) which is much faster.

- Alternate RAM: Set this option to load a program into TT Fast Ram for example.

- Malloc: This option is provided to enable older programs which do not recognise the MXALLOC call to allocate memory from alternative Ram.

- Write protection: protects an application from modification, including being renamed.

- Private, Global, Super, Readable: Only relevant to MultiTOS users. Refer to the MultiTOS documentation.

There's a nice friendly local Atari club close to you, you could pop it
along there and take advantage of a free cuppa for your pains.

Its the Cheshunt Computer Club and is held in the Garden Room of The Wesley
Hall, Windmill Lane, Cheshunt, Herts.

Wrong again. Your crap bit the dust. How do we all know? cause your the last of the kooks who try to bs people here. Btw, you never did give a real reason why you don't visit mac.advocacy at all. Truth is you never have. You haven't been busy since you've never left your parents basement for years. The reality of it is you aren't a mac advocate at all but rather a pathetic loser who attempts to bully others. Its unfortunate the pommelling you've taken over the years hasn't yet taught you the futility of your lies, arrogance and outright stupidity.

>Someting in autofolder, a cpx module an .acc?

I use MAgic, Jinnee and NVDI. Along with various CPXs and autos.
This morning, all NVRAM settings got lost and I end up with it booting in
ST Low and the Atari logo looks horrible. Last time it was on I had a
DMA crash, perhaps it's related?

I get a lot of those crashes and I need to tweak my clockpatch to the ones
described in Chips'n'Chips. I believe a little propogation delay helps.

Yes, what I was wondering is if there is a program that montitors the
clock every 5 seconds or whatever and if the change is by more than 10
seconds it sounds a warning or dispalys a message on the screen. Maybe I
could stretch my poor programming skills to do this?

Yes, I guess this could also apply to the Falcon although chips rarely go
bad.

> As usual, Chretein up north is late to the game...

nope, he's quite ahead of it. Conrad "Tubby" Black thought he had the drop on Jean, and look what happened - he had to sell the National Pest because, despite all his lies and his attacks about Jean (just like a certain fake "Apple Power Rep" in his attacks on "Atari Jihads" who are "out to get him") they all fell apart like a deck of cards. Tubby has now left the country with his tail between his legs, blaming everyone but himself.

And now look at TiFKAS - once again, trapped like a rat, it has to go and try to attack an entire country in order to feed its frail little ego.

And , of course, the real reason TiFKAS is too chicken to go into mac.advocacy: thirty seconds after it opens its big yap and puts its foot in it, it''ll be reduced to a pile of onion rings by .advocacy's denizens. Indeed, one true Mac advocate there who's seen TiFKAS in action has advised it to buy a PC and mirrored glasses with the mirrors facing inward so that it can finish its metamorphosis into a Wintroll :)

TiFKAS will, as usual, deny all and start replying to his imaginary friend "Chunks". Dance for us, monkey boy.......

Source record: 41752

Maybe a dollar short and a year late, but my STe now has a real time clock. Got a Dallas Semiconductor DS1216F chip, (32 pins, for TOS 2.6--earlier TOS uses a 1216E, which has 28 pins) put that under one of the TOS 2.6 chips, and loaded areal36. That almost worked, so I found the only Bill Penner in the state of WA, USA, and called him. There is now an areal37.prg, which displays the year correctly, for years after 1999.

Someone wanted to know if that sort of thing actually works. It actually works.

If areal37 does not come up in a web search, I have a copy.

3637. SuperSAM v.1.08

Newsgroup: comp.sys.atari.st
Date: 2001-09-25 15:18:25 UTC
From: phantomm@bellsouth.net
Message-ID: <5f1s7.17466$2H2.1472170@e3500-atl1.usenetserver.com>
Source record: 41755

A few years ago, I tried to contact the author of SuperSam V.1.08 to register it. This program will record Sound/Music in Memory similar to SAM v1.2 on the Falcon.

I never got any reply to my e-mails.

Does anyone have the full registered version of this program that they would consider selling to me?

There is alot of software that is in the same boat as SuperSam. I have Demo's of some really cool software that I'd like to register but the author has moved on or cannot be located.

I've noticed that back when the Falcon was released (Around 1993) there was alot of cool shareware that followed 1-3 years later. What will happen to shareware software like this?

If the Authors don't plan to upgrade it or use it for any other means, then I do wish they would take a little time to release it to the public or to some folks like me in the US who are interested in making it available to Atari users in the US/Canada and elsewhere.

It seems that in the US the Atari ST-Falcon Software market is looking alot like the Atari 8-bit situation after Atari dumped the line. 2-3 years later original software got very hard to find and shareware stuff from overseas was next to impossible to get. (This was before the Net Boom)
However we have been more lucky, with new releases for the ST-Falcon. And even Cool hardware Upgrades!

Right now I'm looking for large collections of Atari ST thru Falcon registered shareware software, including disk magazines, user group disks, any Hints or DIY info on Disks and etc. Original Commercial ST-Falcon software is also wanted.

So if you have a good collection of the above software and are in the US/Canada and willing to sell or trade it, then e-mail me.

> Subject says it all! Is the Falcon clock powered by a battery that
> needs replacing at some point? Is it easy to locate on the
> motherboard?

Try to reset NVRAM first.
Clock is the biggest black square below keyboard. Chip U64.

Compatible Chips:

MK48T87B-24 (Signetics)
MCCS146818 BM (Motorola)
MC146818A (Motorola)

Mostly found on falcon boards:

DS12887 /DS12887A (Dallas)

No extra batterie to replace.
If the chip doasnï¿½t hold time/date replace chip.

Make shure that time/date isnï¿½t waste by any software!

Regards, Robert

I got out my NVRAM utility and reset the RAM, and so far it appears to have worked. Thanks for the advice - I hadn't realised the clock was part of the NVRAM. How does it work then? I thought it was just static RAM that kept its settings - there must be some sort of power to keep it 'ticking'?

I've come across some settings that I don't understand - can someone shed any light?

Control Panel: two buttons, one with an alarm bell, the other with a C key.

NVRAM: in my NVRAM utility, I've got what appears to be some sort of sleep/wake parameter that you can set to be a number of seconds.

I'm wondering about a similar problem. My Falcon's clock runs fine when the Falcon is plugged in and turned ON, but when I shut off the power strip which the Falcon is plugged into, the clock runs... slow! I have to reset the time every time I turn it on. I had the clock module replaced once, but it made no difference. Does anyone have an idea of what's going on with that?

Thanks,

Clayton Murray

Does anyone know, or happen to have any Wardialers, Box programs, code scanners, etc.. for the ST?

I am mainly wanting them for an archive of BBS software and hacking/phreaking software that I am putting online in relation to old computers..

I realize that most of this software no longer works ..

Mark

I've noticed that mine doesn't keep time very well either - it can be an hour out after a couple of months. My computer usually isn't left on for long periods, it's just switched on and off when required, maybe just for a quick email check or to add a transaction to PFM Plus.

As with my query, I'm not sure how it keeps time when the power is off. A capacitor in the chip maybe that charges up? In which case, maybe it deteriorates with time.

Seems I've opened a can of worms here!

My problem was that when I booted up I got a nonsense date. As
suggested, a reset of the NVRAM has seemed to fix it - it looks like
the NVRAM got corrupted in some way.

As far as I'm aware, it's only the Control Panel that sets the clock,
but I may be (probably) wrong. But it's possible that the NVRAM can
go AWOL on its own accord. I did have problems initially with my
NVRAM in general which seemed to be all messed up, but the utility
I've got to reset it solved all that.

3649. Misc ST items and more FS(USA)

Newsgroup: comp.sys.atari.st
Date: 2001-09-25 23:10:29 UTC
From: fmhcom@operamail.com
Message-ID: <F98s7.52$n12.15204@newsfeed.slurp.net>
Source record: 41768

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

---
60 Meg SCSI external drive in a nice 9.5" x 9.5" x 2.75" case.
Has 2 SCSI 1 connectors allowing passthrough.
Comes with SCSI 1 cable. $60.00

Syquest 44 drive with 1 44 Meg Cartridge and ICD Link.
Drive comes in nice shoebox style case with integraded ICD Link
allowing simple plug and play to ST, STe, and TT. Comes with one
HDX formatted 44 Meg cartridge. There is room for a second
hard drive or even a CD-ROM drive. Has a male SCSI 1 connector
cable already wired. $100.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

Bridge 4.0 by Artworx. Play the card game Bridge on your ST.
Comes with disk, docs, and box $5.00

Renegade by Mastertronic. A space shooter type of game kinda
like Star Raiders? Comes with disk and docs. $5.00

Captian Blood by InfoGrames. A Space Adventure game. Docs state
"This software explores a new concept, the BIO-GAME. The characters
can evolve, be born, die, trade information and generally get on
with their own independent lives." Comes with disk, box, and docs. $10.00

NightBreed by Ocean. This is from Clive Barker's Nightbreed story.
"Make your way through the caverns of Necropolis to the underground
city of Midian and where Nightbreed creatures dwell." "This all
action adventure allows you to shoot, punch, and jump as you
explore the terrifying underground environment of Nightbreed."
comes with disks, docs, and box. $10.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.

For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

3650. Atari TT Hard Drive

Newsgroup: comp.sys.atari.st
Date: 2001-09-25 23:17:42 UTC
From: Richard Stevens <ilikeu@lineone.net>
Message-ID: <3bb10fbc_2@mk-nntp-1.news.uk.worldonline.com>
Source record: 41769

Hi,

I've just tried adding a hard drive (SyDOS44i) with changeable hard drive cartridges to my TT via the ACSI port, and can seem to format and partition the drive via the Atari TT hard drive utilities disk, but cannot seem to get icons on my desktop to actually access the drive.

It has been a while since I have tried to do this sort of thing on an Atari and am getting quite confused. Can anybody help?

Many thanks,

Richard.

All such problems can propbably be referred to the NVRAM chip...

> As with my query, I'm not sure how it keeps time when the power is
> off. A capacitor in the chip maybe that charges up? In which case,
> maybe it deteriorates with time.

It is a Lithium battery which looses it's power after a couple of years -
but it's moulded into the NVRAM chip, so you have to exchange the whole
chip.
Look at my website to find compatible NVRAMs - on the Troubleshooting
page...

If you live close enough, I was just informed of a source of cheap small scsi drives, if $10 USD is cheap for a 1.1 gig drive. Microcenter has a web site, and brick stores. It is the one on Berea Road on the west side of Columbus, Ohio, USA, that has them, and they might even have some left when I get there the weekend after next. I do not know if they do mail order.

Had to ask for the Mackintosh section to get to a person who knew about this.

Hello,

I think the Optiquest Monitor I use on my Hades is going bad. Every now and then I hear what seems to be a spark and the monitor's resolution goes wacko and I end up with something smaller. I fix it by just turning it off for a little while and then turning it back on. I have never run across something like this before and the monitor is only 5 years old. If it does go, then that will give me an excuse to buy a newer more modern one.

Hello,

Carey Christenson emailed with a question regarding a cable modem for
the Falcon. It is below. If you can help, post your message here.
Thanks...

==========

Edward,
Still NO luck finding information on how to hook a
Cable modem to the Falcon 030!!!!! I have gotten my
CD-ROM and CD-Burner to work on my Falcon finally.
Actually the only thing I have burnt is a backup of my
hard drive (which is really important anyways!!!!!!!)
But I may need to get some help from you on this
matter, who knows this may help you out. With getting
cable modem hooked to your Hades 060!!!!! I have
heard of a ROM port ethernet card for the Falcon 030
but there agian do not know where to get this and how
much it cost and how to set up the software that I
have to get it to be able to use cable modem!!!!! Any
help that you can provide would be greatly
appreciated!!!!!! I have had trouble sending
newsgroup posts or I would also try there. I can
recieve newsgroup post I just cannot send them yet
tells me there was an error in transmission through
the emailer program!!!!! Thanks agian and long live
all Atari's everywhere!!!!!!!!!

Thanks,
Carey

3655. Atari Floppy Firewall -- Atari -> LAN

Newsgroup: comp.sys.atari.st
Date: 2001-09-26 03:50:50 UTC
From: Chris Martin <hacked_up@excite.com>
Message-ID: <ugcs7.46265$707.25007923@news2.rdc2.tx.home.com>
Source record: 41774

All,

I am still testing this program, so there may be several issues with it,
but since there is always a need to connect your Atari computer
to the network, I want to go ahead and release this.

I have modified FloppyFW by Thomasez@zelow.no to work with the
ST (or other machines that have a serial port and do PPP). I call it
Atari Floppy Firewall (or AFF).

AFF requires you to have a PC with either 1 or 2 ethernet cards, one
or more serial ports, and a floppy drive. No harddrive is required. You
create a floppy, edit the config file on the floppy for IP addresses and
such,
put the floppy in the PC, and connect your ST to the PC via a null modem
cable.

Once the PC and the ST are both booted, you can run STING on the ST to
connect to your local network and/or your ISP. I am still working on the
STING documentation, but basically you setup your IP address, name server
address, and gateway. You can then configure STING for PPP and
compression. NO authentication is required (this gets around the CHAP/PAP
issues). I use a similar setup at home to connect my TT to my LAN and the
cable modem.

I am looking for people to try this out and let me know of any issues,
problems,
questions, etc. You can download the initial version here:

http://jybolac.virtualave.net/aff/afloppyf.zip

Enjoy!
Chris

This does not really have a special meaning. Depending on the settings
when partitioning and the TOS version the number of clusters may differ.
Looks as if the options used for partitioning were different.

FamilyNet Newsgate

Here is a text that's been rolling in the back of my mind for a while...

Ephesians 6:10-13

10 - Finally be strong in the Lord and in the strength of his might. 11 - Put on the whole armor of god, that you may be able to stand against the while of the devil.
12 - For we are not contending against flesh and blood, but against the principalities, against the powers, against the world rulers of this present darkness, against the spiritual hosts of wickedness in the heavenly places. 13 - Therefore take the whole armor of God, that you may be able to withstand in the evil day, and having done all, to stand.

I've always interpreted this to mean that there is a backdrop behind all of this. It is not so much people verses people. I think for the most part people would be cool with one another. But we have leaders verses leaders. And so forth.
Personally I still like the idea I saw in a Atari Force comic once. A planet of people got tired of wars, so they let all the leaders duke it out, and the common people left. The leaders killed each other off, and they had a peaceful planet. :)

If only.

>
>I realize that most of this software no longer works ..

As one of the old very active phreakers on the Atari, I might be able
to give you some directions :) You're looking for the "X-philes 1 / 2"
and "Black philes" cd-collections. They contain numerous
hacking/phreaking programs, textfiles - and there's also a specific
Atari section, at least on the first ones.

Many of those files are from the old Synchron City BBS (Sweden) btw.

(I know the maker of the CDs, but I don't know if he's still got spare
ones to sell. I have 2 or 3 in the series at home)

> and am getting quite confused. Can anybody help?

Did you use the Atari desktops dropdown menu to create a new drive icon for the drive? Atari doesn't automatically add a drive icon, you have to do it manually. If you already have a "C" icon, make a copy and name it "D". That will become the icon for the external drive.

Bill

The lst2gfa.ttp is now available on my website for download.
In case some have not kept up with changes, it does support
the INLINE command, and now reports syntax errors as well.
Please read the docs before use.

Just a note about the original challenge, everyone who pledged
honored their pledge. One letter however was lost in the mail.
Anyway, I'd like to again thank everyone who showed interest.

Take care, and stay safe.

I have flakey keyboard problem with my Atari STacy. I have taken it apart and isolated the problem to the bus-strip from the keyboard to the motherboard [it's a see-thru plastic with metal lines on it]... The problem is the "bend" has let the metal-strip oxidise causing poor connection...

I'm not don't have much experience with electronics and I'm still trying to get someone to make me a replacement bus-strip... Where can I get one?

In the event that I can't, I want to try to wire the motherboard to a PC keyboard... Anyone know how to do this?

Caveman? not really. I'm setting up a music system for my dad with an accellerated STe. this stuff works fantabulous for music, and other things too. I even saw one in a music studio in that Mariah Carey movie "Glitter", even though it was a full 2 years before the first ST hit the market (it looked like a 1040 with colour monitor which would've been from 1986)

Hi all,

I've now sold the Link 97 host adaptor, but the remainder is still for sale.

Please note the request for responses in email, my ISP seems to be a little unreliable news-wise ATM, and I know that someone has already been disappointed - I still haven't seen his message.

Chris Simon <osian@zetnet.co.uk> wrote:
>
>That explains it - I'm sorry to report that my clock has gone again
>this evening. I left the computer on for a few hours last night so
>that's probably why it seemed fine, but now it's giving me a date of
>31/15/07 again.

If you are really desperate, you can do something like
http://www.stochastik.rwth-aachen.de/~michaels/pics/nvram3.jpg
http://www.stochastik.rwth-aachen.de/~michaels/pics/nvram2.jpg
http://www.stochastik.rwth-aachen.de/~michaels/pics/nvram1.jpg

However, that was a SUN NVRAM. The falcon uses the normal PC ones (DS1287
and similar, made by many manufacturers), so they should be easy to get.

If you are in Germany, I have a batch of used but still useable 1287 around.

Same as here. Canï¿½t say anything again this config.
Works fine since jears. (Two falcons)

> This morning, all NVRAM settings got lost and I end up with it booting in
> ST Low and the Atari logo looks horrible. Last time it was on I had a
> DMA crash, perhaps it's related?

Never hear this before.

Boot up falcon with single tos.
No .Acc, no autofolder stuff.

If trouble still alive check psu. Check memory board.
Make sure the falcon psu works stable and it do not gave spikes to the
mainboard while start up. Check integry of boot partion on hard drive.

Horrable screen display means: Check 4/14Mb memory board.
(Contact problems or some else)

Rom port test module makes a lot of system tests before the machine
comes up to load aes, gem and some else. Best way to make a better
diagnosis.

It may be some program indeed. While I was regularily using STarCall to
contact a local BBS some yars ago, I got the impression that it interfered
with the realtime clock on my MegaST. As I was using a RAM-based TOS2.06
I was fortunate to be able to patch TOS so that the clock could not be
set using regular OS calls. The problem disappeared then.

There may be another cause to clock problems however, but I don't know if
it is relevant to the Falcon: it has happened in my MegaST once that the 7705
chip which monitors power supply voltage and creates a reset was partially
faulty. The consequence wat that it did not properly disable chip select at
power-on and occasionally some garbage data was entered into the clock.

If your DSL modem is external, you can use my Atari Floppy Firewall and use an x86 machine (386 or better) to connect between your PC, TT and DSL modem. Each could then talk to the others, and the PC and TT could get to the
DSL modem connection. You would only need a null modem cable for the connection to your TT.

If your DSL modem is internal or if you just want to connect your TT to your local network, you could also use the spare x86 machine to translate serial(ppp)
to ethernet then use a gateway program under windows, like wingate to allow the TT to get to the outside network.

Here is Atari Floppy Firewall: http://jybolac.virtualave.net/aff/afloppyf.zip

Yes, it is. You have two choices. You can use Ghostlink, but you will need a null modem cable. The other option is PARCP which is what I use. The program uses the parallel printer ports and requires a special cable that you must either build or else buy from the author. Works great. For more info goto: http://users.zln.cz/~pstehlik/home.htm

The Falcon can read the ST disks, run most ST software. Demos and games
are a bit troublesome to run though, often to the degree that they can't
be run at all.

You can buy one of those VME network card for your TT and use Sting for
the TCP/IP stack (or mintnet which now have a dhcp client that should
work with most dsl provider).
here is the link to the network card seller:

Which brings up another question; the Amiga 1200/OS3.1 and other later versions of the Amiga system featured a 'downgrader' which allowed you to turn off caches, slow down some functions and treat the software as a 68000 would so that newer Amigas could easily run the older software.

Anything like that for the Falcon?

The only Atari Emulator that works WELL with Midi programs on a PC is STEEM (info on my site or google.com it) While it works with most midi programs ,it will NOT work with Notator or any dongled program. Due to the intricate Dongle that Emagic made, it is nearly impossable to "crack". They designed it well. This has been doscussed quite a bit on Hallvards Notator grp (http://www.notator.org) and also the steem list.

However having said that, there are lots of Atari-Midi software that DOES work wonderfully on Steem, and that by itself is a breakthru. For instance Dr T's KCS, Master Tracks Pro and more. Check out my site for all those downloads.

The other alternative is to find another "real" Atari as a backup. They CAN be found!!

I never had a falcon (do have several other atari systems) and I remember theres a program called backwards.prg which will allow some of the incompatible programs to run on a falcon. It should be available at various pd libraries and ftp sites.

Hi Tony-

Yes, there are several utilities that try to make your Falcon think it's an ST or STE. They have several options including turning caches off, adjusting the cpu speed, and options for how it handles the sound, and some other things - I don't remember right now. I see 4 programs on my "Falcon2.Sts" folder:

FALCON_X
S2F_1_2
STE_X
BACKWARD.III

I haven't used any of these for a long time, so I can't be of much more help. I think you could probably find them in one of our usual ftp sites. Not sure what category to look in. Maybe emulators, or games, or utilities.

Also - if your Falcon has the Nemesis upgrade, there is a CPX file that allows you to adjust the speed to 8, 16, 20, or 24, and also to turn off 2 caches.

Hope that helps,

Clyton Murray
Seattle, WA USA

If your PC has a SCSI hard disk drive you can directly connect the PC's
and TT's SCSI bus so that the PC can access the TT's drive and
vice-versa.

Hi all,

I've just uploaded AREAL37, docs and software for adding a real-time clock
to an ST to my web site (MISC section).

The software addresses a date error found in earlier versions.

Thanks go to Jim DeClercq for getting the author Bill Penner to update this
utility.

: >the chips socketted or are they usually soldered in?

: In the falcon, they are soldered in.

Oh darn. But they do make J-lead sockets for J-lead chips, which is
somehow new to me. They are sort of cute little things.

Get a pair of fine wire flushcutters, and cut the leads off the dead
chip, and uproot it. Then remove the leads from the board one at a time.

Modify the socket. It will not need the internal supports when it is
mounted on a board, and they get in the way of a soldering iron. Break
them out.

Clean the board contacts with very little pressure, just enough heat, and
liquid flux and solder wick.

Put a line of liquid flux around the pin pattern, put the socket in
place, and solder it in. Two corner positions done first will make it
stay in place. The soldering iron tip goes on the inside, the solder
goes on the outside, and that repeats many times. Check for continuity
afterwards, install new chip in new socket, and wait for that battery to
die.

I've not heard about that beep thingy but it's a good point if it does occur. I'm sure BT will relaise that and they must some sort of thing to prevent it happening when using the internet as it would muck up the data flowing.

New this week at TAT:

* NEW! Frostbite Review by Brian Rittmeyer.
* NEW! Was the 7800 Doomed?
* NEW! Jaguar and Lynx review forms now available!
* NEW! Jaguar and Lynx rarity guides now available!
* NEW! TAT Chat Poll.
* Revisit: Crash Dive Review

Here's a sample of 7800 Doomed, by Joey Kay:

"Once again Atari Inc. was making the same mistake they did with the
5200. There were no new games for this machine. Okay - maybe a couple,
but aside from Desert Falcon, which was merely Zaxxon with a bird, none
of the new games for this machine were a leap forward from existing
games. What Atari Inc. had to offer in 1984 was old, albeit good, arcade
translations. But they were the same games that contributed to the flop
of the 5200."

See you at TAT!

hi!
i have a mint condition original Cubase 3.0 for Atari, in the box,
with all program disks, the impossible to find dongle, manual, and
extras disks.

this is the premier software sequencer for the Atari platform...and as
we all know, nothing out there compares to the tightness and accuracy
of the Atari for sequencing.

Steinberg no longer sells Cubase for the Atari -- this is a rare
chance to get a legal, original copy of Cubase 3.0 with dongle,
manual, and original disks.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1469600222

yes, i put it on Ebay -- but if you want to make a cash offer direct
to me, i will consider it. i will ship worldwide if payment is made in
advance, and shipping is the responsibility of the buyer. i have lots
of references if needed.

i hae personally tested this software, and it works 100%, no excuses.

please email me directly if you have any questions -- and don't
hesitate on this one -- the only other copy of Cubase i have seen for
sale was $399. so happy bidding!

There are several programs (as already mentioned here) which does what the Amiga kick 3.x does, but also alot more. Many ST games and (especially) demos are very hardware-close, and requires perfect syncronizing. Due to different clockcycle-tables of the 030 processor it's not possible to make it act 100% as the ST. Even with caches disabled and clockspeed the same as the ST, it still run faster.

However, games that doesn't use overscan and "synclock"-tricks quite often work using Backwards. But better buy a $15 ST for the old games and demos, then you're assured they work :)

You actually have other options besides 4-bit parallel or serial null modem, both of which are so slow that your ADSL won't feel much like itself on the remote PC. If you have USB ports on both computers, you can set up a USB network to share files and your connection--you can also use a really fast parallel cable made by Parallel Technologies, the people who wrote DCC for Windows. USB is about 45 MB/minute; the fast parallel cable is about 30-40 MB/minute. You can buy the cables online at http://www.lpt.com. A major bonus of buying their cable, besides the speed, is that you also get free internet connection sharing software that is worth $80 with your purchase.

Normally the Control Panel can set the clock. But I also have
CLOCK.ACC that produces an analog chiming clock on my desktop that
allows setting the time and date (as well as alarm time) and any
corrections made are retained even after switch-off. I find my
clock only loses a few minutes over a couple of weeks or so.

If ther ST is very old it may have a single-sided drive. In that
case a Falcon could read disks formatted on it, but the ST won't
read Falcon double-sided disks.

Hi Tony

Which brings up another question; the Amiga 1200/OS3.1 and other later
versions of the Amiga system featured a 'downgrader' which allowed you to
turn off caches, slow down some functions and treat the software as a
68000 would so that newer Amigas could easily run the older software.

Anything like that for the Falcon?

Its called "Backwards".

Hello Steve,

This never happened when the monitor was in the other room, so maybe
that is the problem. I have noticed the brightness is not as high as it
used to be. Maybe there is a control for that in the back. Is there any
way to prevent this? I have noticed that this will happen when I first
turn it on. After that, nothing happens as long as I leave it on.

The ST uses Double Density (720K) floppy disks, NOT High Density
(1.44Meg) floppy disks.

As long as the Falcon disks are formatted as DD, they will be
compatible, as far as the ST being able to read them.

Of course, the ST wouldn't be able to actually RUN any native Falcon
(68030 CPU) software.

What seems to be the problem with the 520ST?

BobR

3734. how can I transfer Atari ST diskimages from the PC back to Atari disk ?

Newsgroup: comp.sys.atari.st
Date: 2001-09-28 23:04:00 UTC
From: Overdoc <overdoc@yahoo.com>
Message-ID: <AI7t7.47838$0v5.1244460@news.chello.at>
Source record: 41704

Hi Atari ST users,

I recently got a Atari 520ST donated, including the 3 1/2 diskdrive and also a Oceanic 5 1/4 diskdrive. Since it came without any software I would like to download some diskimages from the net and transfer them back to real Atari ST disks.
So far I found one PC tool (stupid me forgot it's name) that told it could do the job, but all .msa images I tried ended up in a way that only the drectory could be read, and when loading files was attempted read-errors occured.

Now, is there another, safer way to transfer some diskimages ?
Maybe there is some tool that will let me read a .msa image on a PC formatted disk with the Atari's drive, copy it to ram and then write it back to a Atari formatted disk using the Atari ST itself, and not the PC as the other tool did ?

I know this method from the Amiga, and there it works perfect. So I thaught such a tool must exists for Atari STs, too, right ?

If anyone can point me in the right direction, please don't hesitate.

Thanks for any help,

Overdoc

If it is a humidity problem the A1's might be low, giving a low brightness symptom.

> Is there any way to prevent this? I have noticed that this will happen
when I first
> turn it on. After that, nothing happens as long as I leave it on.

As a test, before you intend using it again, shove a fan heater or hairdryer up its butt for a while before using it and see what effect that has, if that cures the problem then you'll have to do something to decrease the humidity. Start off by strangling any pets you may have, flush any fish down the bog and drain their tanks or drop sodium pellets in the tank.

Its possible that internal dust is aggravating the situation, take the back off and blast its insides with an airline.

having just gotten my Handspring Visor Deluxe, I decided to see just what was out there in the way of programs, and particularly those E-Books out there.

well, I just happened to go onto the Aportis website (they make a document reader for Palm OS) and saw they have an E-book section.

Wouldn't you know it - someone has come up with an E-book History of Atari, from Syzergy to Hasbro, for free download! And it's pretty good, too. Lots of info and fun facts about Atari - did you know that they sold 350,000 copies of Tempest 2000 for the Jaguar? They also talk about the Atari computers, from the 8-bit to the Falcon

If you've got a Palm or compatible and want to check it out, go to http://www.aportis.com/library/index.html and click in the Computers section. You'll need an E-book reader to load and read it.

BTW, the Visor Deluxe is pretty good, too - they've just discontinued it, and so you should be able to grab ahold of one of these for a good price. I got ahold of a refurbished one from the Handspring web site for $119 US + free shipping. This thing has as much RAM as my TT does, and it's turning out to be pretty useful for work-related stuff. Now I'm getting ready to order a digital camera Springboard module for it :)

J-LEAD?

The clock chips are DIP-24, through-hole parts.

>Get a pair of fine wire flushcutters, and cut the leads off the dead
>chip, and uproot it. Then remove the leads from the board one at a time.

This is a bit difficult, because the plastic cap shields access from the
pins.

In uno strano messaggio del 28 Sep 01 wordfiddler@yahoo.com (2:333/608.1)
scrisse al povero All :
w> You actually have other options besides 4-bit parallel or serial null
w> modem, both of which are so slow that your ADSL won't feel much like

It seems there still are many people that do not know ParCP, written by Petr
Stehlik that is by far the best transfer software with a very simple parallel
cable (just swap two wires), so I post few lines again:

[joy@sophics.cz | stehlik@cas3.zlin.vutbr.cz | stehlik@cyberstrider.org]

PARCP stands for PARallel CoPier. It does copy files between two computers.
It acts as a file network running over parallel (=printer) ports of those
computers. This allows you to copy many and large files very quickly from
one machine to another, either by simple drag & drop, or automated in
batch mode or you can choose from two different user interfaces (command line
like in a FTP client and fullscreen windows just like Norton Commander).

It's cheap, it's fast, it's available everywhere, and it's easy to setup and
use.
The PARCP cable is all that's needed to connect two computers, and it can
be build for very few bucks. You can even look around and if you find
parallel LapLink cable, you need nothing but PARCP!
Connecting two computers takes only a seconds decision and a few minutes
work, no need to search for a netcard. This might even be especially
important in the case of notebooks, where netcard are not easily
available.
Not requiring a netcard also means that apart from connecting the cables,
everything else is software configuration (which in principle could be
made very easy).
PARCP can connect two computers running different operating systems. No
need to search for a common network protocol, PARCP itself is a 'common
protocol'.
PARCP needs not to be 'installed' in the way you know it from Microsoft
operating systems - complicated procedure, several reboots, no ability to
uninstall. No! PARCP can be just unpacked and started - and it works!
Without reboots, without conflicts with other hardware or software
components, without headaches...
PARCP can even connect two different platforms, like is IBM PC or clone
and Atari ST (or compatible). For Atari computers it's even more
important, because there are nearly no network cards.
Sometimes a ZIP disk is used to transfer files from one computer to
another - first copy files from one computer to ZIP, then copy files from
ZIP to another computer.
Is that easy? Fast? No!

PARCP easily outperforms parallel ZIP in reading - so if you connect
those two computers with a PARCP cable, it's more than two times faster
to copy the same amount of data from one computer to another.

PARCP has been designed to work on two different computer platforms:
- Atari ST/STE/TT/Falcon and compatible computers (Medusa/Hades).
PARCP is also compatible with all sorts of accelerator cards such
as AfterBurner040 for Falcon etc. Milan is not supported yet because it
lacks the ST-compatible parallel port.
- IBM PC 386 and compatible clones (i.e. machines with 32-bit x86 CPU).
PARCP has been tested succesfully on AMD 386, Intel 486, Intel Pentium,
Cyrix 6x86 and M2 as well as on AMD K6-2 processors.
I will use the word <STRONG>Atari</STRONG> as a general reference for any of
the computers with
Motorola CPU inside and running TOS or compatible operating system
(MiNT/MagiC)
and the word <STRONG>PC</STRONG> for any computer with Intel or compatible
CPU and running
DOS or compatible operating system (Windows9x/OS/2) or Linux-ix86.

The main feature of PARCP is the ability of connecting of any two supported
computers:
Atari <=====> Atari
Atari <=====> PC
PC <=====> PC

(omitted)

PARCP comes in three different binary files compiled for three main
operating systems (OS):
- TOS on Atari (every version from 1.0 up to 4.04)
Patched TOS (e.g. Kaos) and multitasking OS running on top of TOS
(e.g. MultiGEM, Geneva) should be OK for PARCP as well.
- DOS on PC (perhaps from version 3.3?)
FreeDOS and multitasking OS running on top of DOS (DESQview,
Windows 3.x) should be OK as well.
- Linux-ix86 on PC (ELF, from v1.2.13?)
I don't mean DOSemu for Linux, PARCP comes also as a native Linux
application!

All three binary versions of PARCP look and behave exactly the same way,
which is handy for user learning its capabilities.

PARCP runs well under following pre-emptive multitasking OS:
Atari computers:
MiNT
MagiC
PC computers:
Windows95/Windows98
OS/2
Linux-ix86

Please note PARCP can't run under WindowsNT, because this operating
system doesn't allow user programs to program hardware of parallel port
directly. There are two solutions for transferring files from/to NTFS
(WindowsNT native file system). Either use <A
HREF="http://www.sysinternals.com">NTFS driver for DOS/Windows9x</A>
that will allow you to read NTFS under plain DOS or Windows, or you can
use a recent version of Linux kernel (2.2.x) that contains NTFS driver.

Main PARCP features under these enhanced OS:
non-blocking waiting for user action
PARCP doesn't hog OS nor CPU while waiting for user - the average load
is close to zero when PARCP is idle. Therefore other applications
continue working at full speed when PARCP is waiting. Thus you can have
PARCP Server running all the time in the background, always ready for
transmission.
support of long file names (LFN) and file attributes
PARCP allows you to copy files from one operating system to another
with original long file names preserved. Some rather unusual combinations
of possible transfers of long file names between different environments
are listed here:

Windows95's V-FAT <=====> MiNT's minix-fs
Linux's ext2-fs <=====> MagiC's V-FAT
MiNT's ISO9660 <=====> OS/2's HPFS

(omitted)

****
* Note: you need not to build the cable, you can simply buy it! *
* *
* Please refer to the section 6.3 of this document. *
****

The following diagram shows you how to build your own parallel cable for
use with my PARCP (PARallel CoPy). This cable allows you to connect your
computer with any other computer if both machines have either bidirectional
parallel ports or UNI-BI adapter fitted.

The easiest way how to build the cable is to buy a cable for dataswitch.
It's usually marked as 25M-25M. That means there are MALE Canon-25
connectors on both ends of that cable. The cable has either 18 or 25 wires
in itself. The 18-wires one is sufficient for our needs, because PARCP uses
just 18 wires. When you buy that cable, you just need to exchange wires on
pins 1 an 11 at one ends of cable (and to cut the wires on unused pins such
as pin 10,12,13..17).

The PARCP cable should consist of just 18 wires. The wiring diagram is as
follows:

Canon-25 MALE Canon-25 MALE
------------- -------------
pin connection pin
1 ..... 11 (Strobe => Busy)
2 ..... 2 (Data 0)

```
3 ............................. 3 (Data 1)
4 ............................. 4 (Data 2)
5 ............................. 5 (Data 3)
6 ............................. 6 (Data 4)
7 ............................. 7 (Data 5)
8 ............................. 8 (Data 6)
9 ............................. 9 (Data 7)
11 ............................ 1 (Busy <= Strobe)
18 ............................ 18 (GND of Data 0)
19 ............................ 19 (GND of Data 1)
20 ............................ 20 (GND of Data 2)
21 ............................ 21 (GND of Data 3)
22 ............................ 22 (GND of Data 4)
23 ............................ 23 (GND of Data 5)
24 ............................ 24 (GND of Data 6)
25 ............................ 25 (GND of Data 7)
```

The 'schematics' above wanted to say that all 8 data bits are straight wires, while the Strobe and Busy signals are crossed in one connector. The GND is connected in both connectors as well, of course (please note that some cables do not have enough wires for connecting pins 18-24. In this case it should be OK to connect just the 25th pin).

This cable also works with ST-Trans © Atari 1992, with plip protocol of MiNT-Net © Kay Roemer and with HDD_DMN3 by MC Soft & Hard.

Warning: if the cable length should exceed 5 meters, please get a cable with proper metal shielding, otherwise random errors may occur during the transfer.

(omitted)

Resources:

ST-Trans © Atari 1992 (Atari-Atari only)
With simple GEM interface full of bugs and rock-solid but slow routines it's not a competitor for me. However I got inspired by the handshake method used there...

MiNT-Net (PLIP driver) © Kay Roemer (MiNT-MiNT only)
PLIP driver is a modified SLIP driver for parallel port. Can connect two Atari computers running MiNT and MiNT-Net. It's interrupt driven, so it's slower than PARCP. It's a real NET, though.

HDD_DMN3 © MC Soft & Hard 1997 (Atari-PC only)
HDD Daemon is a complete solution for people with Atari ST without harddisk and with an PC computer. HDD_DMN will connect those computers so Atari is able to read PC's harddisk.
Interesting piece of software, but a bit complicated for me.

PC2Am © Michal Kara AKA Lemming (Amiga-PC only)
PC <=> Amiga parallel network software. Powerful and fast (100% assembler). Helped me in the beginning with bidirectional parallel

ports programming.

Are there many SLM804s still working out there? Both of mine packed up and started leaking toner everywhere. They were great while they lasted though. Calamus/HD/SLM804 - no wonder I was late moving to a PC!

What was the difference between the 604 and 804?

Keith

>that all machines have.

Actually I think it's not a screen saver, but the boot delay that pauses the boot process to give time to a hard disk driver to start up. On my Falcon, booting from an internal IDE hard drive, I've set it to off, as HD Driver doesn't need this.

Cheers!

James

Atari 1040 ST, 2 Color Monitors, Lots of Cables, Mouse. Take the Whole Lot for 40$ or make an offer. One monitor you have to turn on and off, then back on for it to work for some reason though.

Also have 3 Atari 520ST's you can have for free with the other stuff, but it will jack up the shipping a bit.

Email me at Dan_M_Sheets@Hotmail.com

I don't know if there are or not. One was sold on Ebay about a month
ago.

> What was the difference between the 604 and 804?

The controller is the same. The 604 is an Epson Action Laser as far as
drums and cartridges go. I believe the print engine is made by the same
company, but can't swear to that any more.

Hi all,

Fresh in are all the files, including text files, needed to update Magic 6.10

to a (mostly) English 6.20. The updater itself is a free download from ASH.

Please ensure that you examine the Readme.txt file in the outer level of the
DDP archive before starting the update process.

Kudos and comments on the archive's contents are welcome.

The board is populated to that amount, but it's been some time since I last
installed one of these. I reckoned that it would add 2 MB to the existing
memory (with the usual 4 MB max).

3753. UK: Caller ID affecting modem?

Newsgroup: comp.sys.atari.st
Date: 2001-09-30 13:40:38 UTC
From: fhahn@cwcom.net
Message-ID: <qhFt7.4222$9y5.55125@news1-hme0>
Source record: 41724

Hi all!

Can someone tell me if having BT's Caller ID service could interrupt a modem connection?

I think that if you had Call Waiting enabled (where you get a beep in your handset if another caller is trying to get through) could interrupt your call, making your modem lose the connection.

Yours,

Fred

3754. MyAtari magazine and MagiC Online launch new Atari forum

Newsgroup: comp.sys.atari.st
Date: 2001-09-30 14:42:43 UTC
From: matthew@myatari.net
Message-ID: <28889b8e.0109300642.3fda5913@posting.google.com>
Source record: 41725

Dear comp.sys.atari.st users,

I am proud to announce the launch of the MyAtari / MagiC Online forum. MyAtari and MagiC Online are working in cooperation to establish a main (primarily English, but international posts welcome) web-based discussion board. German Atari users are lucky to have one or two primary web-based discussion boards such as the one on Atari-World.

Unfortunately, English discussion boards are abundant, scattered, and as a result, do not get the high level of traffic needed for engaging debates and discussions. This forum merger is an attempt to solve this problem. We hope that the MyAtari/MagiC Online Forum will become the primary forum of your choice. Discuss current news, problems, and anything Atari related - and know that a large audience of visitors will see your message.

The forum can be found at http://www.myatari.net/forum.htm

We look forward to welcoming you at myatari.net!

Matthew Bacon, Editor

I beleive thats correct, but its also possible to disable onboard RAM to give the full 4 meg range of the Marpet when populated to the max.

Shouldnt do, its the call waiting aspect that poxes that.

>
> I think that if you had Call Waiting enabled (where you get a beep in

You can edit your dial string to include the number to switch off call
waiting and to turn it back on. The operator should be able to tell you the
numbers if you don't have them already.

Actually "Atari format" and "PC format" are exactly the same.

That is, a floppy disk formatted on a PC can be read on an Atari ST,
and vice versa (with a few restrictions).

First of all, the ST drives are Double Density (720K) - they will
NOT read a PC formatted High Density disk (1.44 Meg).

Secondly, depending on how old the ST is, it may have a Single Sided
disk drive (if it has an external floppy disk drive, the model number
for Single Sided drives is SF354. The Double Sided drives are
SF314).

Unfortunately, it's difficult to make a PC format a 3.5 inch disk as a
single sided (360K) disk. If you have a single sided Atari floppy
drive, you may have to use a special Atari formatting program that
fixes the buggy formatting routine so the disk can be read on the PC.

I believe the PC should be able to read and write a single sided disk, it just won't be able to format one.

Lastly, early versions of the Atari operating system had a bug in the disk formatting routines that made the disks unreadable in a PC. The solution to that is to always format the floppy disks on the PC, and then they will be readable in BOTH the PC and the Atari.

One other thing to think about, the Atari floppy drive, being a lot older, may be dirty or have gone out of alignment so it will have trouble reading a standard formatted disk. If you can format and read a floppy on the Atari, but get read errors from the PC disk, this may be the problem.

The SCSI reader available from Microtech retails for a little over
$400, so it is more expensive to go that route as opposed to the
Mavica. However, the SCSI reader would allow you to use practically
any camera on your Atari now and in the near future.

The original 3.5" PC disks were also 720k.

IIRC, you just have to write the PC bootsector info to an Atari formatted disk for the PC to read it. There were both shareware and commercial programs to do this. I think Double Click software had a commercial formatting program for this, but I honestly don't remember. I probably have it in the Atari floppies I have.

As for the PC formatting a single sided floppy, that depends on the age of the PC and the DOS version installed. As DOS gained in abilities, MS slowly removed things from it like the ability to format a different number of sectors and/or tracks, even tho' the instructions on how to do it (i.e. type in the format command with proper switches) still remained in the manuals.

> then they will be readable in BOTH the PC and the Atari.

That wasn't a bug. The PC needed information in the bootsector of the floppy that the Atari didn't. Atari's formatting routines just didn't write info it didn't need. I can't remember which version of TOS added that to the formatting routine, but I think it was 1.04. I have a TOS 1.04 machine and could format a floppy and find out for those who might

be curious.

> One other thing to think about, the Atari floppy drive, being a lot
> older, may be dirty or have gone out of alignment so it will have
> trouble reading a standard formatted disk. If you can format and read
> a floppy on the Atari, but get read errors from the PC disk, this may
> be the problem.

I would format the floppy on the PC, if you can do it on your PC.
(Win98 will not format a 360k disk, I just checked.) It's just a guess
on my part, but you probably don't have the ability to write the
bootsector information you need in order for the PC to read the disk
even if there is nothing wrong with the formatting and the disk drive.
It would be best not to use a Win95 or newer machine. Try to find one
that has Windows for Workgroups installed, or better yet, one with DOS
3.x on it. Workgroups used DOS 6.22 in it's last incarnation. Then to
double check the PC formatting, you can try the floppy on a Win95 or
newer PC.

>yielded more actual data storage space on the Atari disks.

Actually, I think you're thinking about the Amiga formatting scheme, which
got 880K out of a disk! :)

The difference between an ST formatted disk and a PC one is the boot
sector being different. There is a program that will change the boot
sector into a PC compatible one WITHOUT destroying the data on the rest of
the disk! :)

>I would format the floppy on the PC, if you can do it on your PC.

From what I remember I think you need to do it from DOS - Windows
formatted disks are differently formatted.

Cheers!

James

From: Joakim H&#65533;gberg <fake@false.no>
Message-ID: <Usenet.pdprdprm@localhost>
Source record: 41734

Hi all,

Some may have been experiencing strange behaviour from aICQ lately.
Things that appears be going wrong is that you may see the same offline
messages being recieved over and over again every time you reconnect.
It also happens that the visible list is not working correctly.

This problem is not version dependant, so all aICQ versions will be
experiencing the same problem. In fact, it seems like most clones are
currently experiencing odd behaviour, so chances are that Mirabilis is
up to some changes that it might take some time to adapt to.

Regards,

Joakim

Hi Fred,

>Can someone tell me if having BT's Caller ID service could interrupt a
>modem connection?

It would. If you know what number to call to switch the service off
temporarily, then you can put that in front of the number you call for your
ISP. There will be the problem of turning it backon once you've finished the
data call!

I think that PC floppy routine was/is just too rigid.. Atari floppy
routines read number of tracks and sectors and act accordingly. Pc
routine had fixed sector and tracks number and thus cant ready anything
else.. Also i think ST writed one (or it was 3) bytes of unimportant data
diferently as PC and PC's non felxible routes craps, even if format is
exactly the same.

That is for Magic 6.10, confusing eh? :) It will not work with magic
version .01 which is the one distributed my Atari Workshop in English.
I'm considering upgrading but not sure who to turn to, I guess ASH would
upgrade to the latest, it's just a pain.

>normally.

Hmm. OK, Make sure the board is down on the CPU good and proper. When I
bought the IDEal board it came with a small thing with lots of pins which
you push down into each side of the CPU to open up the gaps. I found it
far to difficult and ended up using a fine pin and doing each pin
individually.

TOS 1.6/1.62 will not auto boot the HD. You will need a disk in the
floppy drive with AHDI in the auto folder IIRC. Also you'll need to
partition that drive up. I'd recommend a 100Mb 'C' drive and split the
rest evenly to about 200MB each. I can't remember the limit on partition
size.

>Any ideas? I've tried pushing the controller further over the CPU but no
>joy. I have also re-soldered the wires onto the IO controller ship...no joy.

Last resort, contact Dave at TUS.

> got 880K out of a disk! :)

Not thinking of Amiga, but I didn't know their formatting would allow

that much data. Mac disks hold 800k, maybe a tad more, I don't remember

that either! <G>

This has forced me to boot up the old Mega 4. <G> And I think I've
been thinking about Neodesk. Formatting with Neodesk 3 gives me about
2k more space than formatting with TOS 1.04.

> The difference between an ST formatted disk and a PC one is the boot

> sector being different. There is a program that will change the boot

That's the program I was referring to when I was mentioning Double Click

software. I've got it around here somewhere, I never throw anything

Atari related away! <G>

> >I would format the floppy on the PC, if you can do it on your PC.

>

> From what I remember I think you need to do it from DOS - Windows

> formatted disks are differently formatted.

I know, James, let's sound "techhie" and really confuse everyone!!!!

ROFL!!

A floppy formatted with Windows 3.x will work fine, IIRC. That's

because 3.x is just a graphical interface on top of DOS 6.x.

I just formatted a 720k diskette on this Win98 machine, and the byte count is the same as I get from Neodesk 3, unless I've managed to mix up the disks. At any rate, I could read the disk on the Mega 4, and a disk formatted on the Mega could be read by this Win98 machine.

I guess the message here is... Only true Atarians would even care! LOL

Message-ID: <A1bu7.785$e9.196465@newsfeed.slurp.net>
Source record: 41651

Hello all,

Well finally happened as I feared. My monitor went bye-bye. It not only sparked today, it would not quit sparking. It sounded like a machine gun. I just packed it up and gave it to the goodwill. Maybe they can fix it. I went out to Sears and go a Compaq 17" monitor. Works great with the Hades. I just had to redo my BIB file. The thing I like about this monitor is that the on/off switch is on the front instead of the back. It also came with two speakers and it has a microphone on the front. Now if I could only get Odd's drive to work with my Hades, I could use these.

It's the truth. Epic thinks there is a future in the Amiga. Sounds
like ATARIUSERINDENIAL again.

ST items for disposal, mostly all original boxes.

The Complete Colour Solution comprising:
Vidi-ST, Video Colour Splitter, Vidichrome ST.
Calligrapher Professional, Diamond Back 3,
EasyDraw 2 + 3 upgrade, Fontfit Plus 4,
Power CD Vol 1, UVK 6.0,
Mini Office Pro (still sealed),
Lattice C 6.5, Power Basic, STOS.

Kick Boxing, Barbarian II, Mig-29, Cyber Sculpt, Cyber Studio
Starglider 2, Corporation, Powerdrome, Magic Fly, Harrier
CAB 2.5, Imagecopy 2 (1 disc), Rainbow 1.2

For collection Worcestershire, UK. Regret cannot be demonstrated -
no Atari available. Any offers?

Hi Troed,

I updated the informations... (cracker ? is the default skill if unknown).

Really hard to design people moves... :-)

Cocnerning your personal informations, there no form to send them, juste send me
an email with (see for example Tsunoo Rhilty from TROLL & Co) :

- Real Name (every field is optional of course)
- email
- country
- major skill (cracker, demomaker, swapper, musician,....)
- description
- history :
1987 : founded the toto crew
1988-1989 : left for tata crew...
2001 : has 5 children and no Atari :)
..

Do you have good logos for ICS, SCSI and SYNC (320x200) ?

Thanks for your help
I'll take time to summarize your SYNC history (so good to read it !
) in order to fill the website.

Bye

MAtt'Us Alem

> Edward S. Baiz Jr.
> (Gamer)

I was sorry to hear this. I for one hate it when a trusted piece of
hardware goes out. I remember the cool monitor I had for my TT.. the one that
Atari made with the base to match the TT. That was fun.

But it started to have the blue jet go out. I worked with it, and tried to
get it repaired, but it was just a VGA monitor afteral. Eventually I gave it
to another Atari user to work with. But I missed it.

The monitor and TT are long gone. I would like to get my STE hooked up to
a VGA monitor, but connecting those two can be a bear!

Oh well... still working with it.

Rest well, oh monitor of the Gamer... you will be missed. ;)

Bonjour :)

You can download and discover the last of my products named
fVDI Configurator. It's a program that generates the
FVDI.SYS file easily in a GEM interface.

This version is made for the fVDI version 0.958b

Download at : http://www.multimania.com/nef/
or directly at http://rajah.atari.org/files/fvdiconf.zip (55 Kb)

The GFA sources are given in another archive.

Bye

Rajah Lone

I've been doing a bit of surfing and found another company called Adtron who do a similar device. SCSI card reader which has a PCMCIA slot and comes with a CompactFlash adaptor. (SmartMedia adaptors are more expensive at between 50 and 70 UKP). The reader itself is $95 which is substantially cheaper than the Microtech model. I've found the UK distributor and have emailed them for a price.

It seems it will behave in the same way as the Microtech device. The description says it works like any SCSI-compatible hard disk or Zip drive, and it will work on any system with a SCSI controller. Even Unix machines are listed as being compatible!

Does anyone have any experience with this device?

3804. Magic Upgrading?

Newsgroup: comp.sys.atari.st
Date: 2001-10-02 18:11:48 UTC
From: Frank Lockwood <lockwood@nucleus.com>
Message-ID: <3bb9a0fa1680970@nucleus.com>
Source record: 41668

I've been trying to upgrade my copyof Magic, which I believe is version 6.01 (but I could be wrong...) to 6.02 using the downloadable files available from ASH. This process requires decrypting the new MAGIC.RAM file by using the original one from the 6.01 installation disk.

I've been trying this, to no avail, which means either the decryption program is faulty, or what I have on my floppy disk is not version 6.01 (but rather 6.0).

Apart from the first line in the MAGX.INF file, is there any way to determine which version I have? My MAGIC.RAM file (the installed one on my boot disk) is 239382 bytes, and dated Dec. 13, 1999.

Can anyone help?

Thanks,

That wont be a problem, it can be appended to the hang-up string.

Hi James

> From what I remember I think you need to do it from DOS - Windows
> formatted disks are differently formatted.

Formatting is done by the floppy drive device, not the OS and so is the same on any platform. The OS sometimes puts its own mark on things by customising the OEM section of the bootsector, which in the case of Atari/Dos.Win-dose compatible disks is "MSDOS"

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

From: Chris <capw@the-wire.com>
Message-ID: <3BBAC927.2E83D1BB@the-wire.com>
Source record: 41677

Hi folks,

I'm trying to setup TOSbox v1.10a on a HP Pavilion 700 mhz Intel Celeron processor with 192 megs of RAM and 30 gig hard drive.. The OS is Windows ME.
The problem is that Papyrus 8 doesn't work too well and TOSbox seems to get all the drive letters mixed up. That is when the HD is partitioned.

Anyone has had any success with TOSbox on a Windows ME computer? What about other Windows based Atari ST emulators? Do they work well with Windows ME? Will any of them run Papyrus 8?

Thanks.
g'day

3817. Re: SLM 804 question

Newsgroup: comp.sys.atari.st
Date: 2001-10-03 14:07:07 UTC
From: Oracle <thisinsntreal@no.its.not>
Message-ID: <fYEu7.117382$bY5.585001@news-server.bigpond.net.au>
Source record: 41682

the 804 is a TEC laser printer, minus formatter board and control panel, all Atari done to it is made a cable to the rear of the machine from the DC controller for the box to plug into and made a bodgie looking buttonless control panel. the biggest problem with the 804 is that in the drum kit the cleaner/wiper blade rubber goes yellow and doesn't clean the drum properly as it rotates, and creates ghosting down the page, this is not uncommon in any laser printer or photocopier that uses toner that's not 100% efficient. myself actually working in the field of laser printer repair can actually fix the 804's drum kit by fitting a canon CX engine wiper blades (first generation) its not the same but you can do some modifying to make it fit.as for the drum it self it can be recoated and the fuser heat roller as well.

as there's no demand for it in Perth, Western Australia, mines the only one ive ever done!

Thanks for the sentiment, but it is not all that bad. I at least found
a monitor that worked. Actually, I love the new monitor better
eventhough it is a Compaq. The on/off switch in on the front and not
the back like the Optiquest.

> The monitor and TT are long gone. I would like to get my STE hooked up to
>a VGA monitor, but connecting those two can be a bear!

Not actually. I did it with my STe. The actual screen output was not
the best, but it is usable. All you need is a Video Key and a video
converter box...

Source record: 41695

Hi, First time I write to this NGs.

I gues this was asked too many times already, but here it is...

How to attach PC mouse to an STE.

I've even found an old 3-button mouse with a large serial connector to it, and ST software supposed to do the thing, but...

I plug the mouse into MODEM port, *.prg runs from a aUTO folder and....

Left and right buttons do work, but it won't follow the moves. Ocasionally a pointer will slide down and to the left, out of the screen. Reminded me of a bad cable thing, but ohm meter showed cable is o.K.

I don't have original ATARI mouse at all, but have the working body of something called "Beatle mouse" (only cable and the jack are missing). It has 8 pin connector inside, as oposed to original 9. If someone could give me a hint where to look for a pinout scheme of this mouse, that could be the easiest way.

Thank you.

The OS must have something to do with it, as formatting under Windows 98
writes something to the disks in order to support long filenames and the
old DOS 8 & 3 filenames at the same time. You can see this when you
write files to the floppy on a Win98 machine and then open that floppy
on a TOS machine. You'll see extra files listed on the TOS machine that
you cannot access nor delete via TOS. At least not TOS 1.04 and 3.XX
(what ever is on my TT! <G>)

3831. CAB vs. Lynx local URLs

Newsgroup: comp.sys.atari.st
Date: 2001-10-04 08:01:17 UTC
From: nospam@zonnet.nl
Message-ID: <hHUu7.29278$2z4.153996@zonnet-reader-1>
Source record: 41600

Experimenting with my ever growing SpareMiNT setup I came across an annoying difference between the way CAB and Lynx handle local URL's.

I wanted to configure my setup so that both CAB and Lynx would make use of the same startup page. In my case: a hotlist.html file containing both remote and local links.
It's the local links that gave trouble:
In CAB a local URL could be something like
file://localhost/e:/homepage/index.html
But with Lynx this URL couldn't be found because Lynx wants something like this:
file://localhost/e/homepage/index.html ("/e" without ":")
And this URL can't be found when I use CAB.
Solution: I had to make 2 different versions of this html file.

Also I had trouble getting the Options <o> and Download <d> menu working in Lynx, as I mentioned in an earlier thread ("MiNT questions").
This was solved after changing "setenv TMPDIR u:\tmp" into "setenv TMPDIR /tmp"
in my mint.cnf file.

Both problems are a result of the difference between the TOS/DOS and UNI*X way of life.
I just thought i'd mention this.

Chris,

One thing about the ST was that it was successful world wide, and so this is
a world wide group.
From the times in your posting I guess you are on the west coast of the USA
so any thing I have here
in the UK is probably useless....

You should pick up an ST on E-Bay or one of the other auction sites for a
few pounds (sorry dollars).
If you want paint programs you might be better to stick to a ST FM rather
than go for the later ST E
because I think some of the paint programs which supported extra colours did
not work on that box.
If you want to use paint programs you probably want a colour monitor as
well, as the Tv Out gets
very wearing on the eyes after a while...

As for programs, well I never had an artistic bent, so I will leave that for
others to answer...

Dave.

3833. FS: 68030/50 Accelerator, Mega ST, ET4000 Graphics Card

Ive got the following for sale from an unfinished project.

Mega ST Accelerator
==========
This neat board includes a 50MHz 68030, a 50MHz FPU,
4M Fast RAM and TOS 2.0.6 on board. Fits into a Mega ST
box. Switchable back to a 68000 (on board) for compatibility.
Drivers on disk.

120UKP

Mega ST 4M with twin HD
==========
Mega ST with 4M RAM. Twin HD in separate unit which goes
under the Mega ST.

60UKP

ET4000 Graphics Card
==========

ET4000 graphics card and adapter for Mega ST. This
gives high resouliton SVGA style graphics, and plugs
into a standard SVGA monitor. Although working when
used by the previous owner Ive never managed to
get this working with my Mega ST above :-(

Hi Steve,

>> ISP. There will be the problem of turning it backon once you've finished
>the
>> data call!
>
>That wont be a problem, it can be appended to the hang-up string.

Yep, except that I mis-read the message as referring to "caller waiting" and
not the CLID service, which won't make a ha'porth* of difference!

*ha'porth - a half-penny's worth, in pre-decimalisation coinage, for non-
English readers! :-)

Four big ones off the top of my head:

Deluxe Paint by Electronic Arts (the best IMO)
Neochrome
Degas
Spectrum 512

After that, there are literally HUNDREDS of ST art programs either by
commercial companies or shareware authors. Here are some sitting on my
hard drive:

ArtST
Canvas
Cyberpaint
Smooth Draw
ColorBurst
AniST
PrismPaint

Good luck!

Hi All

All the Digital-Arts web sites seem to be down. Has anyone got the demo version of DA's Layout for the Mac. I've looked very closely at PageMaker and Quark, and they are not a patch IMHO on either LayoutTC or Calamus. I'm getting PageStream 4, but rally would like to get Layout. Layout Atari, wont run in MagicMac, or at least not for me. It doesn't like multitasking I think. One more reasn for holding onto my Milan.

Hi.
Sometime when Magic crashes, the Os asks for a drive to
dump the memory into a file, as big as the Ram size.
Do you know if the file can be used to determine the reason
of the crash and how to use it ?
Thanks.

>Windows ME? Will any of them run Papyrus 8?

My opinion is that TOSbox is not an optimum choice if you want to use
the emulator through Windows. TOSbox is best used in DOS. Perhaps
you should try other emulators- Gemulator or STem. I have used Gemulator,
admittedly on NT4, not ME, and found it quite Atari-compatible; in fact,
somewhat more compatible than TOSbox. It was also significantly faster.

If I remember correctly, I tried a demo of papyrus 8 both on TOSbox/DOS
and Gemulator/NT4 and it seemed to work. In what way it "didn't work
too well" for you?

Concerning drive-letters being mixed up, is it possible that maybe the
emulator was not configured properly (mounted directores, etc.)?

cu.

Hi Martin,

I've tried it already, using Explorer, it just loops back to the same
page. I'll try it with iCab, but I think that Digital have pulled
everything or the rest of the world just couldn't care less about the
(joint) best DTP program on the planet.
As for freeMint, I run Magic on my Milan, and have to reboot it in
single task mode (Magicboot disabled) to get Layout to work. The Mac
version seemed to be inferior in that it did not have the 'Services'
'plug-ins' and there was not the use of the Mac's builkt in printing
drivers.

Hi Martin,

I've just tried that URL in iCab, when you click on Download now, you
get the error message servor digital-arts.ca is unknown, so it looks
like Layout has disapeared for good :(

Hello all,

I've been having trouble installing an internal HD to my 1040STE. I have installed the TUS developments IDE controller and have soldered the wires to the correct pins/pads on the board. The controller is connected to a 1 Gb 2.5" HD but the ST won't detect it via the AHDI v6.06 driver software supplied with the controller. The HD powers up *and* the red HD LED flashes on power up to confirm that the HD is in fact active. I have the original TOS which I think may be the problem. The ST itself works fine other than the non-functioning HD as the floppy drive is accessed and functions normally.

Any ideas? I've tried pushing the controller further over the CPU but no joy. I have also re-soldered the wires onto the IO controller ship...no joy.

HELP!

From: Bob Retelle <bobr1@provide.net>
Message-ID: <e1cqrto6d4qfq6hm21hdeu7qcuu9a3gbja@4ax.com>
Source record: 41621

I'll be the first to admit that I don't know anything about how the phone system in the UK may differ from the phones in the USA, but unless it's VERY different, I can't think of ANY reason why CallerID should interfere with a modem call already in progress.

As far as I'm aware, CallerID only puts data on the line when a call is ringing, not when a call is already connected.

Once a modem is using the line, any new calls coming in should get a busy signal, thus no CallerID data on the line-

Except- when you have Call Waiting.

Call Waiting WILL disconnect a modem call already in progress because of the "beep" tone it puts on the line.

(There will also be CallerID data, but you wouldn't have this during an existing call unless you also have Call Waiting.)

The way the Call Waiting cancel code works, at least here in the US, is that you prefix your call string with *70

This will disable the Call Waiting feature - FOR THE DURATION OF THAT CALL ONLY.

When you hang up, or disconnect your modem, the Call Waiting feature is re-enabled AUTOMATICALLY- there is no need to append anything to a "hang up string".

Most people just put the *70 in their dialler strings, or many terminal programs have an option to have it pre-pended to the number being dialled automatically.

I'd say definitely give the phone company a call and find out how to disable Call Waiting- that's most likely the problem.

>a 520ST or a 1040ST.

Definitely go for the 1040ST. The extra RAM (total of 1 Megabyte)
will probably be needed for any serious work with graphics.

There are RAM expansion kludges available for that class of machine,
up to a physical limit of 4 Megabytes, but in my experience, none of
them are totally reliable. Atari simply did not design these machines
to be user expanded (much like early Macs).

The 1 Megabyte 1040ST should be able to handle most of the graphics
programs you'll likely be working with. (Moving into Desktop
Publishing graphics will require as much RAM as you can get)

Also, the 1040ST has a built-in floppy drive, while some of the early
520STs required external drives.

>
>> If you want paint programs you might be better to stick to a ST FM rather

>

The 1040STe is an "enhanced" version of the 1040ST. It has several
expanded capabilities, most notable of which is the use of standard
SIMMs for its memory. It can be expanded to 4 Megabytes very easily.

It also has improved sound capability and analog joystick ports (which
were hardly ever used).

More to your purposes, it also has an extended graphics color palette
which while nice, can be incompatible with some of the earlier
graphics software. Some of those programs used software tricks or
features of the hardware to trick the eye into seeing more colors than
the standard machine could deliver, but they may not run on the STe.

There were a very few graphics programs which actually did make use of
the extended capabilities of the STe, but very little software was
ever released which specifically took advantages of the new features.

For your project, probably the best approach would be to use a
"normal" 1040ST, and simply make reference to the extended
capabilities of the STe.

Umm... maybe.

The Atari monitors have a proprietary 15 pin DIN connector. In all
reality, it might be easier to just obtain a system which comes with
an Atari color monitor than to try to kludge up a cable, or try to
find one commercially available.

>> As for programs, well I never had an artistic bent, so I will leave that for
>> others to answer...

>
> Thank you for your assistance.

Probably the best suggestion for obtaining Atari hardware is to check the "Vintage Computers" category on eBay. There are often complete systems being sold for a song. (It almost makes me want to cry when I recall how much my first 520ST cost, with a monochrome monitor no less).

Also, it's been reported that Atari systems can be found in "thrift shops" like Goodwill stores, or in pawn shops, usually for only a few dollars. That approach might take more time than you want to invest, but it's an option. At least it wouldn't involve any shipping cost, which can end up being almost as much as an entire eBay system would cost.

And finally, there are usually a few systems being sold right here in the Atari newsgroups.

I have been and gone and ordered the Adtron SCSI card reader plus CF adaptor from Peak UK. Unfortunately, the $95 including the adaptor as advertised on www.kodak.com translated into 163 UKP for the reader plus 8.50 for the adaptor, plus VAT. Oh well, at least it's cheaper than the Microtech reader.

3863. Dead monitor - any ideas what might be wrong ?

Newsgroup: comp.sys.atari.st
Date: 2001-10-05 19:37:27 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <3bbe0bf7$0$13425@news.zetnet.co.uk>
Source record: 41632

Hi all,

One of my SM124 monitors just went blank the other day. It was being used on an STe but I know the computer's O.K. as it works fine with a spare monitor.

The only clue is that the power LED on the front is very dim, in fact it seems to fade (but stay on) shortly after power-up, and the screen stays dark. Any chance this might be a simple one-component repair, or does it sound fairly disastrous, like maybe the tube blown ?

Thanks in advance

Paul

: it, and ST software supposed to do the thing, but...

: I plug the mouse into MODEM port, *.prg runs from a aUTO folder
: and....

: Left and right buttons do work, but it won't follow the moves.
: Ocasionally a pointer will slide down and to the left, out of the
: screen. Reminded me of a bad cable thing, but ohm meter showed cable
: is o.K.

Try another PC mouse, with a D9->D25 adaptor if necessary.

: I don't have original ATARI mouse at all, but have the working body of
: something called "Beatle mouse" (only cable and the jack are missing).
: It has 8 pin connector inside, as oposed to original 9. If someone
: could give me a hint where to look for a pinout scheme of this mouse,
: that could be the easiest way.

The Beetle mouse is a lovely mouse. You don't need all nine pins if you're
just using two buttons. You should be able to trace the pin assignments
with a voltmeter.

If you're into conversions, you have two options. Either you may get an
old PC bus mouse (recognised through their odd-looking mini-DIN connector
with a lot of pins, which uses the same quadrature signals as an Atari,
and solder a D9 connector on that one. Alternative 2 is a bit more
involved. You take a common PC serial mouse, remove the serial encoding
chip and add some discrete electronics in order to get the right
quadrature. This procedure is described somewhere on the NetBSD/atari page
(http://www.netbsd.org/Ports/atari/).

If you're feeling really adventerous you could build an interface that lets you connect a standard PC serial mouse to the ST's mouse port.
I tried this a couple of years ago, it takes a little electronics knowledge, but it works very well, is completely transparent to the Atari and requires no extra software to be loaded.
Unfortunately I can't seem to find any links to the site that contained the circuit, it seems to have completely vanished :-(

If you have a SM124 made by Goldstar, which has the brightness, contrast
and off/on volume recessed on the right side of the monitor, the most
likely cause is blown capacitor(s). Just look for the burned, brown
colored circuit board. This also means you have a blown fuse or two.
The capacitors and fuses can be replaced, soldering required.

It's based on PC chipset right? It'll probably do 66Mhz, as most 486s
will do 66Mhz bus even though the manuals say 50Mhz max. You going to do
it? You know you want to Jo!

I was an Amiga user at the time as well, but didn't mention it for fear
of arousing any long simmering bad blood. I have a pretty decent collection
of Amiga paint programs, although I am looking to expand that collection
as well. I'd like to get boxed copies of as many of these Atari and Amiga
paint programs as I can.

I'll take your suggestion. Unless there were some really amazingly
innovative programs that used the capabilities of the later machine.
It sounds like the situation with the Amigas that used after-market
graphics cards.

> The Atari monitors have a proprietary 15 pin DIN connector. In all

I'll look, thanks. Hopefully I can get a decent selection of software
at the same time. I'm looking for other older systems, including a
Mindset. I remember how much I lusted after that one back then.

Thanks again for the help.

I know Deluxe Paint from the Amiga and PC. Dan Silva wrote Deluxe Paint, Deluxe Paint II and Deluxe Paint III on the Amiga (IV was written by someone else and lost the clean design). The PC version was roughly feature equivilant to Amiga Deluxe Paint II. Was there more than one release of Deluxe Paint on the ST, and what was it equal to on the Amiga? Did it take advantage of the ST's feature set?

Degas was familiar as well, as was Neochrome.

I'd love to get ahold of official copies of these, as I'd like to get the manuals. I'm getting old, and don't seem to be able to figure out a program at first glance anymore. :-)

Thanks!

Actually, when it comes to raw CPU-power it's not as fast as my Falcon/AB,
and the graphics-card is noticable slower than the Eclipse in my Falcon.
However, I'm going to do something about this ASAP, and will hopefully
have fitted a 33MHz upgrade and a RageII-card with fVDI this year.

The fact that the Falcon has occupied my best and most expensive monitor
all this time suggests that I've never stopped being an Atarian ;-)

Could this be it?

http://members.aol.com/tgkirk/pcstmous.htm

It's a pretty simple circuit and can easily be assembled on a piece of
Veroboard, but most people doesn't have equipment to program PICs. It's
probably easier to buy an adapter from Mario Becroft, they're not
expensive and works extremely well (I have one).

Some Amiga-shops still have Amiga-mice, these can easily be converted to
work on a ST.

That's the one!

Thanks, I'm glad you posted the link to it. I've been trying to locate the
sourse code for the PIC as some of it may be usefull for another project
I'm working on.

3879. Megafile problem

Newsgroup: comp.sys.atari.st
Date: 2001-10-06 11:07:34 UTC
From: J&B <j_b@pandora.be>
Message-ID: <WBBv7.88322$6x5.19652733@afrodite.telenet-ops.be>
Source record: 41497

Hi,

My Megafile 30 is not responding anymore and I suspenct the cable to be broken. Does someone has the wire diagram for this cable so I make a new one and test it again?
The problem is: when I start the system, without the megafile connected but with a diskette inserted I get the GIU. When I start it with the Megafile connected, I get the same GIU. I can not see the hard drives I once partitionned and formatted. I used this system some years ago for the last time and It was working perfectly. Now I donnot remember anymore how this TOS worked.
Could someone give me a hint please?

Thanks a lot,

Jake

That sounds good. Loony Purcell has the Microtech card reader and he
likes it. I have a Sony Mavica that puts the images on a 3.5" disk and
that works well for me.

Could be a componet repair. I would see how much it would cost to
repair it, then decide if you want to do that or else buy a new one. I
have seen many for sale for only about $50.

It does have jumpers to select clock speed, in fact it can be set to run
at upto 50Mhz. However, some of the logic on the motherboard doesn't work
reliable above 25MHz, so I have to replace three small 74157-chips with
faster ones.

I turns out that this is affecting pretty much all older clients that rely on version 5 of the ICQ protocol. Seems to be affecting even ICQ 98a as well as mICQ, Licq and a bunch of other clients according to messageboards around the www.

There is a chance that the feature to save contact list on server must be supported by the client in order to get rid of the newly introduced problems.

Regards,

Joakim

> MagiCMac in, the icons either show up correctly, or they end up
> extremely ugly. I believe this has something to do with the palettes,
> but what do I do in order to make them show up properly -all of them?

Since no one else seems to be keen to reply, I will do my best.

I think the main problem is that the icons afaik depend on a certain system palette, where up to 256 colours are specified. IIRC the CICON addresses the AES colour index directly, hence why the palette must be set to match the palette under which the icons were created/mapped. The only standard we have these days, is the NVDI palette (also used by CAB I think)

At least I think this is what needs to be done. I don't know if CICONS with >256 colours are possible, and the icons in the Atari Icon Library are only 16->256 colours.

I found this from an older thread about the same thing:

-- SNIP --

> I have used GEM-view 3.16/3.17 extensively for 2 years now, and its a
> fine program. One thing always has annoyed me...what IS the STANDARD
> 256 colour system palette? This issue I have not been able to sort

> desktop. I'm having trouble as well with 16 colour XIMG pics and
> converting them to CICON's for use as desktop/window icons. Is there
> a standard for the Atari system palette? If there is, no 2 pieces of
> software seem to have the same interpretation of that...

I battled with this myself. In the end I simply used the system palette that CAB adheres to. Run CAB while in 256-color mode and then, with an ACC or CPX, look at the system palette: it's comprised of the 16 core colors, followed by the "Web-safe" colors, and then finally by 30 or so "special" colors. These special colors are significant because they compensate for the limitations of the core and Web-safe colors, allowing for more accurate color definitions when remapping an icon or background image. The key is for the system palette to have the broadest spectrum of colors available.

If your system palette is matched with CAB's, there'll be no palette swapping when alternating between the desktop, especially important if you're using icons and a background image with more than the 16 core

colors. Jinnee users won't experience this because the system palette
is integrated.

The first thing to check is whether or not the hard disk drive
mechanism inside the Megafile case is actually "spinning up".

When you turn the power on you should hear the drive start up (not
just the fan noise) and begin turning, and then start "clicking" a bit
as the heads seek.

You might have to put your ear right against the case to be able to
hear these "startup" sounds.

There used to be a problem with the hard drives used in the era of the
Megafiles, where the read/write heads would actually "stick" to the
surface of the disks (a condition called "stiction"), and sometimes
the motor wouldn't have enough power to break the bond, especially if
the drive had been sitting unused for a long period of time.

If you do hear all the startup noises, and the drive spinning up,
that's good news-

Other "good news" is that those hard drive cables are pretty tough- it
would take a lot of abuse to break one. It's a possibility, but it's
likely to be something else.

Do you have the hard drive driver floppy disk to install the Megafile?

Hallo Jo Even!

JES>However, some of the logic on the motherboard doesn't work reliable
JES>above 25MHz, so I have to replace three small 74157-chips with faster
JES>ones.

That's my experience, too. My Milan would even work with jumpers set to 30MHz,
but only as long as I don't try to access the SCSI card :-(

My SMD soldering experience being non-existant, I don't want to do this
modification myself. Thus, I've got to stay at 25Mhz :-(

mit freundlichem Gruï¿½ aus Ahornberg

So sad, too bad, but the lastest version of Newsie, found on chapelie,
makes my STe behave better. Newsie 94 works fine on my TT, but my STe
crashed when the message count in a usenet group was wrong.

Do not know what changed, but I like it.

That is a new one on me, I think. I have fixed a bunch of them, and have a lot of spares.

I, personally, would check the rectifier diode bridge, since you may be getting half-wave rectification. I would replace all the diodes, since on of those 120 volt diodes on 20 volt service failed, and caused me to rewind the power transformer twice, by hand.

And while I was in there, I would replace the flyback timing 2.2 uf unpolarized capacitor, which can cause flyback failure. I made up a 2.2 uf out of plastic capacitors, which are unpolarized, and electrical tape to make them into a bundle. Soldered long leads to the bottom of the original holes, and tossed the bundle up under the bottom of the tube.

The tube is not a big problem, if you know of a tube rebuilder. The sm124 design started out life as a NCR bank machine monitor, and tube rebuilders have a lot of spare guns. So, for that matter, did the SM1224 and there might be guns for those.

So, even if only one component has failed, I would replace at least five, before putting the case back on.

Yes, does sound like half wave rectification. Get better rating diodes than the ones in there, which are pretty good at it is.

No, 486-based systems rarely runs above 33Mhz, and 33Mhz is the limit on
the PCI-bus anyway. I don't think the Milan would run reliably above 33MHz
even with modifications.

Yes, there are three 74xx157 (don't know the exact spec, as I haven't checked it myself) under the CPU that needs to be replaced with faster ones. Check Ingo Schmidt's homepage for more info, I don't have the URL here but check my PC's hotlist at http://jo-even.dyndns.org/default.asp?page=search (check the Atari-directory).

> always useful ;-) I remember seeing something about this on a German

You have to remove the CPU, and replace three surface mounted chips. It's not really difficult, but don't do it if you don't trust your soldering skills...

Ahem, ever heard of Vesa bus, or VL as it's sometimes called. I had it
running as 66Mhz with my AMD DX4 set to 2x multiply to give me a CPU speed
of 133Mhz. Problem was that the VL bus was a bit unstable when it came ti
running DOS and I think the DRAM was being pushed way over it's limits,
especially as it's only FPM!!! But it runs everyday with 50Mhz bus and VL
cards are stable, it clocked in the speed of a DEC 486 server, nice :)

>We are searching Logic 2.5 ... and we can't find Logic 2.5 on this FTP :-(
Not surprising. As far as I know, the upgrade to Logic 2.5 was/is
commercial. I paid 995 FF for it from the French distributor.

>Does anyone have it?
>Please ... help ... I need somebody to help ...
If you're willing to buy it, I think someone in the French newsgroup
should be able togive you the address of a French distributor (it was IML,
but my understanding is that Emagic activities were taken over by another
company).

No idea who would be the English distributor.

Hope this helps.

Apple betting audio pros will like Mac OS X 10.1
by Dennis Sellers, dsellers@maccentral.com
October 5, 2001 2:30 am ET
http://maccentral.macworld.com/news/0110/05.audio.php

Now that Mac OS X is quite polished with version 10.1, Apple is betting that the next generation operating system will continue to keep the Mac popular among musicians, audio pros and music educators.

In promotional/review materials for Mac OS X 10.1, Apple boasts that the operating update "introduces an array of audio capabilities that will ensure Apple's place as the preferred platform for music and audio." The new audio services are designed to make music systems more powerful and easier to configure than ever before. So what's included in the feature set that "lays the foundation of the next generation of killer music and audio applications"? Let's see what Apple is promising.

High resolution audio, for starters. The professional standard for high-resolution audio is 24-bit/96-kHz audio. Mac OS X 10.1 goes beyond this standard by managing all audio as 32-bit, floating-point data. "So your Mac not only efficiently handles today's high-resolution audio, but it's prepared for tomorrow's even higher resolution audio formats," Apple says.

Multichannel audio. The Mac operating system has historically offered two-channel stereo output only. While that may be okay for some applications, Mac OS X 10.1 is designed to handle higher-end software by delivering native multichannel audio capability scaleable to "n" channels, which enables features like 5.1 channel surround sound from your Mac. It also provides software with multichannel recording capability, which gets rid of the third-party middleware that was once needed to deliver over two channels of audio to hardware devices.

Mac OS X's HAL (Hardware Abstraction Layer) provides high-performance, ultra-low latency communication between apps and I/O (in/out) devices that's "measurably more efficient than in previous solutions," according to Apple. The result: there's no delay for timing sensitive audio data as it makes its way from the input device through the Mac OS X audio infrastructure to output. Apple says that Mac OS X is fast enough that musicians can play MIDI instruments through the computer in real-time. This means they could use the Mac as an effective synthesizer for live performance. Apple says "this kind of audio performance hasn't been available on any other computer platform without expensive and time-consuming system modifications" and that it "rivals the performance of specialized audio hardware."

Mac OS X also makes another break from tradition. No longer does the Mac operating system have to use third-party software to manage MIDI. Mac OS X includes MIDI services that Apple describes as "world class," providing software apps with the ability to manage MIDI and define a system wide MIDI configuration that's available to all applications. What's more, Mac OS X provides music services (the fundamental functions of MIDI sequencers, including common MIDI editing routines like cut, copy, paste and repeat) to applications.

Digital audio can also be enhanced with digital signal processing (DSP) plug-ins that process audio, such as applying reverb or distortion, and send the processed audio back through the audio system. Though DSP plug-ins for the Mac have flourished over the years, they come in a variety of formats that aren't always compatible so developers have often ended up making different versions of their plug-ins for different applications. Mac OS X is designed to make audio plug-ins more universal by offering a system-level plug-in protocol called Audio Units.

Apple says that Audio Units offer the Mac developer community a way to deliver plug-ins that will work with all the audio apps running on the Mac. Mac OS X 10.1 delivers several Audio Units, including a Velocity Engine optimized reverb and a sample rate converter.

The new audio architecture of Mac OS X will combat two problems that relate to timing, one endemic to the process of recording and the other a by-product of its new "industrial strength" OS.

A significant challenge of music recording and production is to ensure that tracks presently being recorded can be synchronized to previously recorded tracks, and also to ensure that they can be written back to disk correctly in time. (The delay between reading the previous tracks from the hard disk and routing them to the musician is called latency.)

Prior to Mac OS X, companies developed their own technologies, which included buffering, to combat latency and to allow audio tracks and MIDI channels to be routed to the artist in unison, enabling the musician to play "in sync." Digidesign's TDM (time-division multiplexing) and Steinberg's VST (Virtual Studio Technology) are two examples of this type of technology for dealing with audio. (The inclusion of folders bearing these acronyms in OS X's libraries indicates both these technologies will be accommodated in OS X.)

The preemptive multitasking and virtual memory capabilities of OS X's BSD core, where the CPU will be called upon to regulate computing time between a variety of applications and processes, would have proven too great a challenge for a third party developer to combat. (Under previous versions of Mac OS, most sequencer developers have required that virtual memory be turned off.) Moving these services inside the OS frees developers to concentrate on enhancing their interfaces and adding post-production capabilities.

And MIDI (Musical Instrument Digital Interface) timing and device control in OS X will finally move beyond the venerable OMS (Open Music

System) and Mark of the Unicorn's FreeMIDI applications. The presence of Doug Wyatt (the developer of OMS) on Apple's music team shows that the company will build upon -- and presumably surpass -- the world standard in this area. The document distributed at WWDC claims that OS X will handle MIDI with a latency factor of one millisecond, almost real-time performance.

Of course, the power of this audio infrastructure won't be realized until music apps go Mac OS X native. But it's happening. BIAS is bringing Peak and Deck to the next generation operating system; Logic is on the way from E-Magic. And others are in the works.

Peak and Deck are the two flagship products from BIAS. Peak is the company's two-channel digital audio editing program for the Mac. The Carbonized version is scheduled to be released in November, making BIAS one of the first developers to release a professional audio tool to support the new Mac operating system, according to Christine Berkley, BIAS vice president of marketing.

A Carbonized version of BIAS Deck -- the multitrack audio editing, mixing, and signal processing program, with support for up to 999 virtual tracks, real-time automated mixing and multiple plug-ins -- is due soon after the Peak release, she added. Along with supporting all the enhancements provided by MX OS X, the forthcoming versions of Peak and Deck will also run under OS 9. In developing these new versions of Peak and Deck, BIAS is working to ensure that both programs are fully compliant with Core Audio, a key component of Mac OS X, Berkley said.

"Our customers will certainly benefit from OS X's more publicized features, such as protected memory space for enhanced system stability and of course, the very cool Aqua interface," she added. "But thanks to Core Audio, Peak and Deck will also support new generations of multichannel, multiclient hardware, with performance that can exceed 24-bit / 96kHz. Just imagine, for instance, running Deck on channels 1 through 6 of an audio interface, while simultaneously running Peak on channels 7 and 8 -- and that's just the tip of the iceberg."

Details such as pricing and new feature enhancements for the forthcoming Mac OS X-compatible versions of Peak and Deck haven't been announced yet.

A Carbonized version of Deck VST 3.0, their multitrack digital audio workstation, is also in the works. Deck offers support for VST, Steinberg's widely adopted real-time plug-in format. The latest version, Deck VST 3.0, ships with more that 25 free VST plug-ins, including Waves AudioTrack, featuring Paragraphic EQ, Compressor, Limiter, Expander and Gate.

Emagic, a manufacturers of software and hardware for music and audio production, is beta testing Mac OS X versions of Logic Audio 5.0, and drivers for the Unitor8 MkII, AMT8 and MT4 MIDI interfaces and the EMI 2I6 audio interface are due any day now.

The company's Mac OS X support reinforces the Mac's position as the platform of choice within the professional music, film and multimedia industries, according to Dr. Gerhard Lengeling, founder and chief developer of Emagic.

Logic Audio is a music and audio production software package that combines digital audio recording and editing, digital signal processing, MIDI sequencing and music notation. It's targeted for those into music and audio production and post-production.

"From the very beginning, it was important for us to support Apple's new driver concept for MIDI and audio hardware because it's the best way to use recording programs with Mac OS X," he said in a statement. "Our new music production suite will support many of Mac OS X's new features, such as memory protection for increased system reliability, the new graphics engine with transparency and flicker-free performance, real-time window sliding and improved memory management."

Drivers for the Emagic MIDI and audio interface series fulfill the requirements of the new MIDI and audio driver standards of Mac OS X, Lengeling said. By chaining up to eight Unitor8 MkII and AMT8, up to 64 separate MIDI inputs and outputs, or 1024 MIDI channels, are supported. In addition, the EMI 2I6, the 24 Bit-capable USB audio interface, has two analog inputs and six analog outputs, as well as one S/PDIF digital input and one S/PDIF output.
***
Well that looks promising, I'd say.
Please note that Apple is still selling (G3) models without Altivec/Velocity Engine. Besides DSP/vector stuff the engine can also do multiple floating-point operations per cycle making it run as if there are multiple cores on the chip. So you are better off buying a Powerbook G4 than the cool iBook. Also note that you can upgrade a cheaper Powermac G4 tower to include dual G4 chips, with 2MB high speed cache. Whatever you do don't buy regular RAM from Apple, get GBs dead cheap elsewhere. If you're tinking of secondhand, you should probably wait untill new models are introduced early next year.

Why not try Okami? It's great, I will register Jos but I've had a lot of
expensies recently and now my soldering irons element has gone and I'm
left with an underpowered (15W) Weller.

I'd be very pleased if anyone could instruct me on how to use software found on the net on an atari computer. The software in question is an editor for the Yamaha tg500 sound module. I think its called 'take 500'. I dont have a PC but have access to one at university. At home i have an Atari STe midi'd up to a Yamaha tg500. The problem is that the Atari doesnt read the software i've downloaded at univeristy. Do i need some kind of conversion?. It's the same problem i have with sound samples for my Emu 6400 sampler, it doesnt read the wav. files that i download through the internet, i should imagine i need some kind of conversion for this as well. If anyone can help, it would be great but bare in mind that i am a novice when it comes to using P.Cs
THANKS

Quin.

I'm sorry but why have you just wasted bandwidth for all of us? It might be of interest to those who have Macs, but there is nothing about Atari mentioned here.

It should have only been posted to a Mac group and not to here.

Cheers!

James

Just take it to a local electronics shop. A skilled professional will only
use a few minutes to replace those chips.

Yes, I had one of those myself, although it never worked properly above
50MHz. But the Milan doesn't have VESA, but PCI (thus nothing in common
with pure VL-based 486 except that both fit in AT-cases.), and PCI is
limited to 33MHz. It's *possible* that the Milan itself will work above
33MHz, but what about the PCI-cards?

I had one of those rare and late 486 with both ISA, VESA and PCI, and a
Pentium Overdrive clocked at 133Mhz (PCI 33MHz, VL 66MHz). What a piece of
junk... It's by far the worst PC I've owned, I think I had it for a month
or so before I sold it with a huge loss. It did finance a 14Mb card for my
Falcon though, which at that time cost me around GBP330...

What was the file extension of the program you downloaded? An "exe"
entension means it is a PC program. I would think the the wave files
you downloaded should work if they are PC files. If they are Mac files,
then they possibly may have to be ran through a conversion program. I
have a program that converts MID Mac files to a format than can be used
by a PC or Atari.

I would check out Tim's Atari Midi World and see if the program is
there or else ask Tim about it.

Yeh, thats true, I didn't think about that. I know some cards will work
above 33Mhz but then we have limited choice with Ataris. Is it not
possible to put in waitstates, does the Milan have a PC style BIOS? I've
heard of PCI running around 40Mhz but you have to be picky on the cards
you use.

Could you tell me exactly which three chips it is? Some more speed is
always useful ;-) I remember seeing something about this on a German
page, but my understanding of German isn't up to start messing about
with the hardware.

Well, as I've already posted, yes I've ordered it, but it was slightly
more expensive than $95 in the UK!

I did think about asking someone in the USA to get one for me....but
it's a bit of a hassle!

Bonjour :)

Just for fun, you can find the last of my products at
http://rajah.atari.org/files/stars.zip (17 Kb carefull,
you cannot access to it via my homepage). The GFA source
is given for the curious.

'Tis yet another starfield, but in pure VDI and not blocking
the multitasking. I just made it to see how the new graphic
cards, the lastest machines or acceleration cards were quick.
At light speed like in Star Trek ? ;-)
Carefull: runs since 256c and above.

Bye

> a 520ST or a 1040ST.

Of the two above, definitely a 1040ST (or 1040STFm). Larger RAM (1MB)
would make quite a difference, and the all-in-one design was very
convenient.

Note that there were also a 1040STe (in the same box but with enhanced
graphics, and easiy expandable to 4MB), MegaST (nice-loking design with
separate keyboard, existed in 4MB variant) and MegaSTe (a different looking
4MB design, somwhat faster and with enhanced graphics too). And there were
two Atari models significantly different from the ST series, and yet
reasonably compatible: the TT (a much faster 32-bit design, noted for
high-resolution monochrome video), and, of course, the Falcon, with DSP
capabilities, a good choice of colour video modes and resolutions
(the ultimate colour-graphics Atari computer). The last two models were
(and still are!) rather expensive relative to the ST series.

> I'll have to do a bit more research. I wish to run the largest range of
> graphics programs, both older and more recent. What is the best choice?

Beside the already mentioned programs, Megapaint, Papillon, Chagalle,
DA's Paint and Photoline deserve attention, but they are best suited or
machines with at least 1MB of RAM, preferrably more than that. There were also
some quite good Falcon-only paint programs, but I am not familiar with those.

Some paint programs are developed even today, e.g. Vision
(see http://vision.atari.org), which is shareware.

> I have some analog color monitors from that period like an Electrohome
> long-persistance monitor.

Attention: for the ST series (520ST, 1040ST, 10140STe, MegaST, megaSTe)
you would need an analog-RGB colour monitor with 15.6kHz horizontal sync and
50-60Hz vertical sync rate! Monochrome high-resolution mode was run on
a different (TTL-level) monitor with 35.7kHz horizontal sync and 71Hz vertical
sync rate. Most (s)VGA monitors could be used for monochrome mode after some
fiddling with connectors and cables. There were some, like Nec Multisync II

and some monochrome multisync monitors, which could be used for all
ST video modes.

For a ST or a Falcon a good SVGA monitor would do in most cases (except
the monochrome-high on TT which needed an ECL- compatible monitor).

>sound fairly disastrous, like maybe the tube blown ?

If the LED barely works, it looks as if the power-supply is not delivering proper voltages. So it could be a power-supply malfunction, but locating the faulty component may not be obvious.

Otherwise, some other component (an electrolytic capacitor?) has burned horribly and is practically shorting the power-supply. See if you can find a blown capacitor inside (probably looking swollen instead of normal cyllindrical shape). Also, look for a component which is very hot or maybe it even burned (yellowed) the PCB.

ATTENTION! lethal voltages can remanin in the monitor even after it has been disconnected from the mains.

Cu.

No. The PCI->ISA bridge comes from an Intel PC chipset.

The CPU->PCI host bridge is a PLX 9080, and the glue logic and memory
controller are custom designed using CPLDs.

It will work up to 33MHz if you have good DRAMs (and use 74FCT or similar
for the DRAM address multiplexers), however, the chances at 30MHz are
better.

>you use.

The PCI hostbridge can operate using an asynchronous clock, so with some
"minor" modifications (you do have the PCI specs, don't you?), it should be
possible to run PCI at 33MHz and the CPU core at a higher frequency.

However, that will definitely require reworking the DRAM controller - the
current timing is just enough for 33MHz (where the bootblock already sets
one waitstate, compared to zero at 25MHz).

There is one electrolytic on the power supply that typically fails. As I recall its a 2.2 mfd 50v non polarized capacitor. It should look burned and leaking some black stuff if thats the problem.

3946. New Drawing Contest

Newsgroup: comp.sys.atari.st
Date: 2001-10-08 00:30:47 UTC
From: Bengy <bengy@mac.com>
Message-ID: <B7E64FD8.3A88%bengy@mac.com>
Source record: 41567

New Drawing Contest!

We're happy to announce the sponsorship from a local gift shop, allowing MagiC Online (http://www.magical-sides.de), already one of the premiere Atari sites on the Internet, to hold weekly and semi-weekly competitions. The contests are short and fun - designed to bring the community together and showcase some of the talent we have on this platform.

First Contest:

It's almost Halloween, so the first contest will have a spooky theme.

The challenge: Draw a "scary" picture with an Atari theme. It could be a picture of a boy trick-and-treating wearing an Atari shirt, a spooky floating Fuji symbol, an Atari computer in flames, or any other creepy image you can think of. Use your imagination, and have fun!

The prize for this week's contest:

Cyber Chuck
It's not easy to keep up with technology. Just ask Charlie Brown. When it comes to the information superhighway...well, let's just say he's in the slow lane. Which is not to say that he doesn't keep trying. We are talking about Charlie Brown, here. For your favorite cyberspace fan ï¿½ a fun look at our favorite cyberspace traveler. (Porcelain figurine sculpted by Anita Marra Rogers.)

Dimensions: 3 5/8" high.

A certificate of authenticity accompanies this Hallmark Keepsake Collections Numbered Edition. Carefully crafted from the very finest materials, this heirloom-quality piece was designed to be treasured for years to come.

Rules
Pictures may be created by traditional means (pencil, paper etc) and scanned, or can be created completely dgitially.

All pictures must be your own work!

Submissions must be sent to support@magical-sides.de by Monday Oct. 15

Submission of picture means you agree to MagiC Online using your work in promotional or site-related material.

That's it! The executive (static) staff of MagiC Online will judge who the winner is, and the first prize winner will be sent the prize. Remember, this contest is to have fun, so make sure to!

Contest page: http://www.magical-sides.de/contests.html

3949. Update to the Westfront PC Translation Project :)

Newsgroup: comp.sys.atari.st
Date: 2001-10-08 07:50:32 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <7a1fd8df.0110072350.1bce0569@posting.google.com>
Source record: 41570
Cross-posted to: comp.sys.amstrad.8bit,comp.sys.atari.st,comp.sys.dec,comp.sys.msx,comp.sys.ti

Hello,

For those interested, I have been working feverishly to produce a version of Westfront PC: The Trials of Guilder for the following platforms:

Apple II/IIe
Commodore 64/128
Atari 400/800
Sinclair
MSX
CP/M 2.2 and above
Commodore Amiga
DEC Rainbow
Acorn
Palm IIIc
Amstrad
Atari ST
Apple Macintosh
TI 99/4A

Since the game itself is already ported to MS-DOS and Windows-compatible computers, playing it shouldn't be all that difficult:

http://www.geocities.com/dunric/westfront.html
(or an alternative link to)
http://members.tripod.com/~panks/westfront.html

I believe this game is possible to port to any of the platforms listed above, although each version would have to be suited to the individual system's capabilities. Since the game was coded in a flavor of BASIC, it shouldn't be too difficult to port to those systems:

http://www.geocities.com/dunric/wftrans.html

I have tried using UBASIC, PowerBASIC, ByWater BASIC, Chip Munk BASIC, GFA BASIC, and a host of other interpreters/compilers but few seem to handle the game in even the MS-DOS size.

Therefore, I am calling upon all programmers proficient enough in the BASIC or C language that are willing to port a version of the Trials of Guilder for their specific systems to write me at: dunric@yahoo.com

The reward is nothing more or less than a playable version of the game on whatever system it is attempted to be ported to. The best method I

can think of is to write the data files for the game to disk and to keep variables and arrays to a bare minimum. Verbs can be cut down to a minimum of 14-18, depending on the system. Nouns in the game...well...use your imagination. :) If there are fifteen different swords and shield and helmets, that's probably too much.

So to aid in the translation efforts, I have compiled a "bare bones" list of the items and monsters available in a "minimal" version of Westfront PC: The Trials of Guilder.

Here's the list:

VERBS

GO,GET,WIELD,UNWIELD,WEAR,REMOVE,DROP,KILL (or
ATTACK),BUY,SELL,PUT,READ,EXAMINE
LIGHT,USE,EAT,DRINK,INVENTORY,LOOK,CLIMB,SCORE,SAVE,QUIT

(23 or so verbs)

ITEMS

BAG
LANTERN
FUEL
ROPE
GRAPPLER (a grappling hook)
NOVEL
SCROLL
KEY
IRONKEY
HELMET
BOOTS
FORCEBOOTS
SHIELD
ARMOR
CLOAK
ROBE
RING
CHAINMAIL
SHROUD OF SAINT NEPHAN
DISC OF ATHENS
GLISTENING ANKLET
ORB OF TRUTH
SPELLBOOK
KNIFE
DAGGER
SWORD
LONGSWORD
BROADSWORD
SLAYER
HOLY MACE

```
GLOWBALL
SCEPTER
TORCH
SHOVEL
MATCHES

(35 or so items)

MONSTERS
--------
SKELETON
CLERK
DRUNK
VILLAGER
VETERAN
BARTENDER
FALDOR
WOLF
WARRIOR
MONK
ZOMBIE
GOBLIN
TROLL
PALADIN
WRAITH
BEAR
DRAGON
BARBARIAN
THIEF
INSPECTOR FUNKYDOG
JESTER
SORCERER
SPIDER
ELF
HOBBIT
WIZARD
GUARD1
GUARD2
GUARD3
GUARD4
NINJA
SENTRY1
SENTRY2
SENTRY3
SENTRY4
CENTURION
ADVENTURER
SENATOR
BISHOP ROLAND
SOLDIER
```

(40 or so monsters)

Now for the room total. I've thought a great deal about this and I realize that the original room total of 1,728 (across 4 continents) is just way too much for most systems to handle. So I've decided a good number to try for would be between 200-300 rooms. A lot can be packed into each room, including multiple descriptors and other events.

Quests: Quests are entirely optional and may be included at the whim of the programmer. It may be as simple as "Rescue the princess from the dragon" or as complex as "Destroy the evil army, save the city, and return the enchanted goblet to the city of ankahan."

Let me know if this sounds like a good idea. I feel this game could be a fun experience for all involved.

Regards,

Paul Panks

AFAIK you need the driver and utilities disk to gain access to the drive. Having the manual is very helpful in understanding what you are doing. I had a SupraDrive, but have sold it and no longer have access to the original utilities disk or manual. I do, however, have a copy of the utilities on my hard disk. If you like I could do an attachment and send them to you.

>Quin.

You can download files with a PC and transfer them to your Atari with
no "conversion" needed.

BUT-

Your Atari will NOT read a "normal" PC floppy disk.

You need to format a floppy disk ON THE PC, but you must format it as
a 720K disk.

Go to "My Computer" on the desktop and Double Left Click on the icon.

Put a floppy disk in the floppy drive and Single RIGHT Click on the
Floppy Drive Icon (usually marked A:)

Single Left Click on "Format..." on the menu that drops down.

Under "Capacity" at the top of the box which opens, click on the
downward pointing arrow then click on "720Kb (3.5")"

Click on the button marked "Start" in the same box.

This will format the floppy so the Atari can read it. Copy your files
onto this disk and try it in the Atari.

I am firing up my old ST again and would like to change the old 20 meg HD.
I don't have a formatting/partitioning program for a larger drive. Can
anybody supply one?

Thanks in advance.

Mike

3956. FS: Lots of H/W & S/W

Newsgroup: comp.sys.atari.st
Date: 2001-10-08 16:18:39 UTC
From: nmontaser@hotmail.com
Message-ID: <e657320c.0110080818.ffe2eb0@posting.google.com>
Source record: 41577

Hi,
Just doing a bit of cleaning up. Here is a list of ATARI H/W and S/W
looking for a good home.

Looking to get $95 USD for the lot, or Best Offer + shipping.
Might be willing to sell individual pieces.

H/W:
Tseng Lab ET4000 ISA graphics card only -- 1MB
Deka Interface (attaching AT/XT KB to ST)
Magnum 16MB Fastram Board for Falcon, unpopulated. (from axis) --
Brand New
Tabby (can't find the quill driver)

S/W highlights:
Programming:
Pure Pascal 1.1.1, full documentation
PureC + upgrade, full documenation
Pure Profiler (still haven't see anything better in the CURRENT
Market, compared to NT, WIN 2K)
Interface 2,
Programming books including ATARI Compendium (new edition), a few
Abacus Series, etc.

Productivity:
EASE 4, full documentation
Wen.suite docs?
Magic + Magic Mac 2 + upgrades to 6, german documentatin

Graphics and DTP:
Arabesque 2
Calamus SL + 98 upgrade disks, full documentation
Pagestream 2.2, full documentation
Atari works 1.2 + speedogdos 4/5 + fonts, no documentation

+ potentially other misc h/w + s/w, as I find them.

Most s/w comes with original disks, manuals. Some other are misc
backsups. I haven't tested the disks in a couple of years, so I don't
know whether they are all in good shape. But if not, I am sure
something can be done to salvage them.
Sale is AS IS. No warranty.

If interested, please leave me an email, or call 613-277-5577

cheers,
Nima

BTW, for those looking for Homa Systems Website, it will be
operational shortly.
If you want to leave an email, use: homa@canada.com

I know this isn't quite the forum for this, but maybe there are old computer types out there (mainframe hobbyists?) who would be interested. I've rescued a practically new-in-box Visual 50, which is an ASCII RS232 terminal with your classic green CRT look. It handles VT52 and ADM3A protocols. Includes operator's and maintenance manuals (with schematics!). I've tried it out and it works fine. I don't want anything but the shipping to a good home from Tucson, 85711.

Chris

I have just contacted Peak UK and they have quoted me 240UKP + carriage of 5.50UKP + the deadly VAT!!

Is there another model available at the lower price?

I was thinking of getting one at just under 200UKP, but nearer 300UKP is surely getting on the Microtech model?

Regards

Neil

Lyndon:

Thanks for the advice, you are right about the interface board, a royal pain to fix (my thumbs were sore after fixing it) I'll try to lever it in a little more as soon as I get a chance. BTW is TUS Dev. still around? I searched on the 'net but only came up with a few broken links. If you have some contact details for them I'd appreciate it.

There is indeed a 2.2 uF nonpolarized electrolytic capacitor in SM124
which typically fails, but it is not in the power supply- it is in the
horizontal stage. It is best to replace it with a non-electrolytic type.

Hi,there's "AHDI" Atari's original Hard Disk Utilities.You can download it
at http://www.umich.edu/~archive/atari/Diskutils/.
A newer and better alternative is HDDriver,it's the best of all but it
is commercial...a DEMO at http://www.seimet.de/index.html

: equivilant to Amiga Deluxe Paint II. Was there more than one release of Deluxe
: Paint on the ST, and what was it equal to on the Amiga? Did it take advantage
: of the ST's feature set?

No, not really, and there was really no feature set to take advantage of
(the ST's graphics are lower-resoluting and less flexible in all aspects).
It didn't feature animation either, as I recall.

Did you ever see Cool Hand Luke, with Paul Newman? The famous line from
the movie is "What we have here is a failure to communicate", spoken by
character actor Strother Martin.

Looks like we are talking the same thing, but you are defining format as
just the electronic "layout" of tracks and sectors, and I've been
defining it as tracks, sectors, and the necessary information stored to
make the data accessible.

Such is life. <G>

Yes - when I spoke to them they asked me which model I was after, one was more rugged than the other and suitable for industrial environments. I said it was just for home use, so I guess this would the cheaper of the two models. It should be arriving today, so I can see what they eventually did charge me! But I was certainly quoted 163 plus VAT, the total bill (inc. P&P and CompactFlash adaptor) comes to around 207.

I also mentioned www.kodak.com where the same reader including the CompactFlash adaptor is advertised for $95. He said that it was probably the parallel version as that would retail for that sort of amount. But I've looked at the site again and it's definitely the SCSI version that's advertised.

This list was last updated on 10/09/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 3.00 Art & Film Director (Epyx) -- $5.20 shipping, due to
weight, counts as 1st item
$ 3.00 Death Sword (Epyx)
$ 3.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 3.00 Final Assault (Epyx)
$ 3.00 GFL Championship Football (Gamestar)
$ 3.00 Keith Van Eron's Pro Soccer (Microplay)
$ 3.00 Lands of Havoc (Antic Software)
$ 3.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 3.00 Quadralien (Spinnaker)
$ 3.00 Renegade (Taito)
$ 3.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)

$ 3.00 Warship (Strategic Simulations, Inc.)
$ 3.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 3.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 3.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 3.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 3.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 6.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.20 shipping, due to weight, counts as 1st item

$ 6.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 6.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 6.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 6.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 6.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 6.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.20
shipping, due to weight, counts as 1st item

$ 6.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the
U.S. are also accepted (postal money order, PayPal or cash only!)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

3977. Re: Digital cameras

Newsgroup: comp.sys.atari.st
Date: 2001-10-09 12:26:46 UTC
From: Chris Simon <c.simon@bangor.ac.uk>
Message-ID: <3BC2ED06.C5E1458F@bangor.ac.uk>
Source record: 41447

It's arrived! But I can't test it out yet as I didn't order a cable with it. I already had a spare SCSI cable, but it was difficult to find out from Peak exactly what connector the reader had. So I've ordered a cable from CPC today - for reference the unit has a 50-way "half pitch D type" SCSI connector, the other end needs to mate with your computer or the last device in your SCSI chain, which in my case should be a 50-way Centronics-type plug. The power supply also needs an IEC-type mains lead. I'm borrowing a CompactFlash card to test it out with before splashing out on a camera! I do hope it works...

BTW they didn't enclose an invoice in the package, only a delivery note, so I can't confirm that they only charged me the lower price!

No, because in this case the drive would not have been recognised at
all.

> I'm a little concerned about the mention of "A:" as I'm not sure if this

A has a different meaning for SPIN!. Please refer to the SPIN!
documentation for details.

TUS can be contacted via Keychange Music. +44 (0) 1925 266120

barrie@keychange.co.uk

I have fitted a few IDEals ok. Have you tried a different drive?
Is it new or pulled ? Is the drive set to master / slave or cable select ?

Who supplied the IDEal and the drive?

> I have the original TOS which I think may be the problem.

Keep only boot info, NVDI etc on C. If C becomes corrupt it's much easier
to restore a small partition, unless you have it copied to another partition

200 mb for the rest is OK.

What exactly do you see as the ST boots?

> > Last resort, contact Dave at TUS.

See above, where are you?

or email tus@keychange.co.uk or send the drive to me and Dave will check it.

Barrie at Keychange.

There is an adapter for using PC serial mice on Ataris made by
Mario Bercroft in New Zealand available commercially. The UK
agent is Chris Crosskey of Abingdon Synthesis Projects - email:
chrisc@zetnet.co.uk or
chris.crosskey@metrics.co.uk

Cost is around 15 UKP plus post&packing - can't recall exactly.

Regards, /Peter/

> OK. Hopefully the monitors will still be functional.

It was a *13*-pin DIN. In the UK and Europe leads are/were available from this to a SCART connector that plugged into most newer TVs and also Atari monitors like the CM 8852. Unfortunately you didn't use SCARTS on your side of the pond... - but monitors should still be available.

Early arts programs (presumably not b&w drawing programs) you want to know about also include Master Doodle, Cyberpaint/sculpt besides the original Neochrome, Degas and Degas Elite. Later came Hyperpaint, Chagalle, Megapaint, Photoline, Pixart, Smurf, True Paint (and T-Image) and several others, many for the Falcon only. Obviously the higher colour/higher resolution programs needed more memory than the native 1MB of the 1040 STFM, specially if you were handling large images. For the latter, somethimes even the 14MB Falcon ain't enough!

Regards, /Peter/

Please keep us informed - I for one would be interested! I get
many PDF documents sent to me by the BSI and Ghostscript is
really slow. I also find that sometimes the latest version of
GEMGS (1.3) will only read the first x pages while 1.2 is OK.
Similar with the non-GEM GS versions.

One of the reasons for the low speed is that GEMGS and GS insist
on reloading ther required fonts for each page, even if there are
no changes. I hope Eric Reboux solves this!

Regards, /Peter/

3990. looking for an inexpensive CD-RW SCSI drive for Atari?

Newsgroup: comp.sys.atari.st
Date: 2001-10-09 21:53:53 UTC
From: Daniel Dreibelbis <dreibel@sympatico.ca>
Message-ID: <dreibel-584F9F.17535309102001@news1.on.sympatico.ca>
Source record: 41463

Found this on one of the mailing lists I subscribe to for finding
good bargains for my computer, if you've got a SCSI-based Atari setup,
here's what you can get for backup/archival/song CD burning for use with
Roger Burrows' CD utilities or the other stuff out there:

EXCLUSIVES!

Yamaha 8x/4x/24x CD-RW SCSI internal for $79 shipped - 1:01 pm
Madlogix.com offers the the Yamaha CRW8424S 8x/4x/24x CD-RW SCSI
50-pin internal drive for $79. That's $8 less than our last mention
and the lowest price we've seen. These new, retail-packed drives
include Adaptec Easy CD Creator for PCs, Toast 3.5.7 for Macs,
cables, and two pieces of media. Mention "dealmac" when ordering and
shipping is free.
http://dealmac.com/newsdaily.html?article,27025

BTW, Dealmac rocks for all sorts of info on stuff going on sale, and
not just Mac stuff.....

Hi there,

I am wanting to set up a quick st bbs. I have it and some doors and whatnot off a crawly crypt cd. But I need to get a demo.key and later on a fully registered key. I know the original suport bbs that one could register from is not up now. I searched on the net and found a link to a place in england that handled the software registrations up till 2 years ago but when I try the site it not responding, Anywone know the current fate of quickbbs st and where to get it?

I have just acquired a 520ST from a garage sale + original box, floppies and manuals and software.

It works fine, but I have to force the original mouse to click. Can this be fixed by taking it apart? Or is it totally worn out?

Is there a good source in the UK for bits?

I have the receipt for the original puchase - over 1,300 pounds. At last I can afford it.

Have you tried using a differnet letter to A? I use X and Y (I have 2
CD-ROMs) but I imagine that would conflict with your logical drive letter.
I've never understood the letter that links the two, something to do with
GEMDOS or something.

I am not sure what your problem is, but I it may be a setup problem in
Spin. I have a Link II hooked up to my STe which has a CD rom drive. I
use Extendos Gold and HDDriver and all is fine.

As your old drive was working with the same setup there are two things
that might affect the new drive:

1. SPIN! might have problems with this drive. I don't think this is the
case because there are several users with SPIN! and Plextor drives. I
also have a Plextor drive (40x), which works fine with SPIN!.
2. SCSIDRV might have problems with this drive. You should ask the
author, Steffen Engel, for assistance.

Provided that SCSIDRV causes problems I recommend upgrading to HDDRIVER
8.1. Since HDDRIVER 7 there is no need for SCSIDRV anymore because
everything SCSIDRV offers is included in HDDRIVER, which also supports a
newer version of the SCSI driver interface than SCSIDRV.
This will only help, of course, if it's actually SCSIDRV that prevents
the drive to be accessible.

>The strange thing however is that the old 2x Apple CD-ROM drive works
>fine, but not the new one.

You've checked that the option jumpers match on each drive? There's usually no need to change them though, usually. Have you tried booting with a CD in the drive?

>I bought it used, but I don't think it's malfunctioning as it shows up
>when booting and in the SCSI ID checker (forgot the name of it) that
>comes with HDdriver.

Why not download the demo version of HDDriver and give that a try? You can get rid of scsidrv.prg then, just make sure that you have the corresponding option set in hddutil.prg - oh, and set the SCSI ID of the CD in Devices/Partitions.

FWIW my Spin! installation was:

Auto:
config.sys
iso9660f.dos
metaxbs.prx <- this is not a typo!
spin_sd.bos

/xtension
spinmagc.xfs

My config.sys file:

*BOS, c:\auto\spin_sd.bos, A:10
*DOS, c:\auto\iso9660f.dos, Y:A
;CDROM is ID2 (8+2 mapped to icon Y)

This all on a Falcon - for a true SCSI port one has to add 8 to the ID that you've set the CD to.

This setup worked perfectly for a Plextor 40* drive, and the disk and on/busy lights worked as they should (I can't remember the exact sequence now).

Re installing the drive in your Apple, don't you need a third-party driver to access non-Apple drives?

There is a small microswitch inside that can wear out. They are easily
replaceable. Sometimes the plastic lever that pushes on the microswitch
wears down and can be built up with glue.

I once got that, I just couldn't partition this drive as the root sector was damaged. I think I could do a format but it didn't help, it was some time ago. Anyway, I removed a SCSI CD ROM from the chain and the drive partitoned no problems at all! I have a feeling that that CD ROM was causing problems and just the other day it died on me. The light just stays on and the motors all lock themselves up. I want to try my SCSI hard drive back in but it needs cooling.

Hi Lyndon,

LA>Have you tried using a differnet letter to A?
that letter does _not_ in any way correspond to the floppy drive, so
it doesn't matter which character to you use to address your CD ROM
drive.

My CONFIG.SYS runs like this:

```
==================================zip=========================================
; CD-Tool BEGIN
; Note that everything up to `; CD-Tool END' will be erased by
; CD-Tool's configuration tool!
;
; created by CD-Tool 2.14, Sat Jan 22 19:09:08 2000
;
; devices
;
; SCSI 2: `PIONEER CD-ROM DR-U03S' -> A
; SCSI 4: `PIONEER CD-ROM DR-U03S' -> B
; SCSI 6: `YAMAHA CRW8424S' -> C
;
; BOS drivers
;
;*BOS, c:\metados\hs-cdrom.bos, B:12, C:14
;*BOS, c:\metados\spin_sd.bos, A:10, B:12, C:14
*BOS, c:\metados\spin_sd.bos, B:12, C:14
;*BOS, c:\metados\scsi_cd.bos, B:12, C:14
;
; virtuelles CD-ROM Z:, wenn Image auf M:
;*BOS, c:\metados\cd_image.bos, M:67
;
; virtuelles CD-ROM Z:, wenn Image auf N:
;*BOS, c:\metados\cd_image.bos, N:67
;
; DOS drivers
;*DOS, c:\metados\hs-iso.dos -c256, T:B, W:C, Z:M
;*DOS, c:\metados\hs-iso.dos -c256, T:B, W:C, Z:N
*DOS, c:\metados\hs-iso.dos -c256, T:B, W:C
;
; CD-Tool END

==================================zip=========================================
```

Explanation: This CONFIG.SYS permits me to run 3 drives, even 4, if I
count the virtual drive, too. Virtual drive means that the driver

shows me the CD image produced by CD Recorder as a CD.

LA>I've never understood the letter that links the two, something to do
LA>with GEMDOS or something.
So it's for me. I only know that in your example, you may replace the
letter 'A' with any character, but in _both_ places of its appearance!

And the 'X' gives you the letter you have to provide an icon for on
the desktop. And one should avoid the letter 'U' in order to avoid
conflicts using MagiC.

Und TTschï¿½
ps

It also appears as if the visible list if working again! Hurrah!

My guess is that some backwards compatibility on mirabilis servers was
lost when upgrading to a new protocol version. Looks like they cured
that glitch now though!

Oh well, I am happy again now :))

Message-ID: <9q2ejdnlv1@news8.svr.pol.co.uk>
Source record: 41476

Dear All

Just to let you know, I have been negotiating with Brad Templeton the author of Alice Pascal (a Pascal Interpreter) into making it available on his website for downloading.

I first remember seeing this program reviewed in Atari User (I think) many years ago, it may have been sold by HiSoft(?) at one time. I saw a mention of it on Matthias Jaap's site and went to Brad's website only to find that the IBM PC was the only version available for downloading!! A link to a review of the Atari ST version was hopelessly out-of-date, so naturally I had to enquire from the author as to whether he had a copy anywhere!

Brad wanted the programs available for those with Atari Emulators, whereas I wanted a ZIP file for true Atarians(!). I have supplied him a .MSA file and a ZIP of the two single-sided master disks that he still had, these I believe have been put on his website and are available to FTP.

The website is:

http://www.templetons.com

The ftp is:

ftp.templetons.com

Here are some of the features found in Alice(PC)

* Syntax directed editor with flexible input -- type just about anything anywhere.

* Integrated, visual programming environment with debugger

* 700 help screens

* Ask at any point what can be typed, or help on any symbol or language feature

* "Cursor Following" debug mode -- watch a program in action

* Hide or reveal subsections of programs for readability and structure

* Multiple program workspaces with cut and paste

* Turbo Pascal compatibilty. (Use as editor, then output as text to compile.)

* Customizable

* Includes standalone interpreter, text file input and output to work with other tools.

* Fast Pascal interpreter

* Works on as little as an 8088 PC with 384K of RAM -- also in DOS box on modern Windoze 95 or Windoze NT computer at lightning speed. Or an Atari ST at warp speed 9!

Unfortunately when trying to test it on my CT2B Falcon I find that I can't get it to work even with plain TOS and emulating ST High on a VGA monitor!! An alert comes up with "System Font must be 8 bits wide" OK.

Any suggestions would be helpful.

Neil Chester

Hi all,

Its been fun these last few years supporting Atari by hosting loads of Atati stuff on my site. It had to come sooner or latter and that day has arrived. The server i was using to host all my Atari files on seems to have vanished without a trace. This does not supprise me one bit as so many other servers have done the same. I kept moving my site again and again until now i giveup. I know there are a lot of people who find it a good resource who will be sorry to see it go but theres not much i can do about this. All the files are gone appart from the ones hosted on the Atari FTP servers, i think Belgian ftp has a mass host of files which i uploaded a while back, if not then hopefully there are still running.

I was thinking of moving the site again but theres gigs of files there and all were uploaded on a 28K modem which is the best i have, its no fun and doing this almost every year is no fun at all. As the site is getting few hits these days then it seems little use in uploading again. I've supported Atari for as long as i can and enjoyed every moment of it! I have no regrets appart from seeing the Atari scene the way it is after knowing what it used to be years ago.

You can still access the downloads ont he FTP servers though dont expect too much from anything else on the site. Please note the hompage is www.cps-games.co.uk even though the site pages are on Freeserve. The site will be survive in some form though what i will be i have not decided yet. One thing i maywell do is burn the site onto a CD or 2 as i still have all the files at hand, plus a load more which i never got around to uploading.

Chris

Why should I care that wintel users do not use the Apple platform.
It's there loss not mine. I suspect that the new Apple retail stores
will attract the fence setters and the low hanging fruits.

So what crap have I spewed?

millions in the technology field know how to spell. Unlike you.

> You sound like the class wise ass, always perfect...but rediculed..

no, they laugh WITH me, not AT me. With TiFKAS it's the opposite.

BTW, it's spelled "ridicule" . Come back when you've graduated
remedial kindergarten....

> > yes, TiFKAS, we all know about how much you like to "Palm"
yourself :)

well well well. Remember "98% of all Atari applications fall over on
the Milan" ? Remember "Pointcast will completely destroy Atari from
the Internet"? Remember "I never said Calamus was crap"? Remember "I
never said that Steve Jobs would destroy Apple if he ever came back, or
that I called him an arrogant bonehead"?

> > You're certainly not serious about getting ahead and bettering

I have bettered myself, pinhead. Last March I got a promotion, a raise, and some additional employee training which has now added to my resume.

You'd be lucky if you were able to sell pencils from a tin cup, much less getting any job in the computer industry.

> *note, sinclap maybe absent due to sending back the field PB to former
> employer..

well well well - someone finally noticed your shoddy work and gave you the boot. That's what you get for acting as much the fool here as you did in the field.

BTW, can you now give us evidence of who formerly employed you? Or are you still bound by a "non-disclosure agreement" (read: BS) that prevents you from sharing that info, O former fake "Apple Power Rep".

Razor gots news fer ya, sincrap - Razor's spellin' errors are all
parta a gag, showin' dat even a guy actin' an idiot can gets bigger
laughs an' makes an even bigger point den one who truly IS an idiot.
sincrap claim dat he big shot Crapple power rep, when he make all sortsa
mistake regardin' Macs, an' he can't even spell right.

Faces it, sincrap, yer form o' Mac advocacy is nothin' more den
smelly ol' disnosaur droppins. Maybe it time ya gives up whiles ya still
behind.

Me knows Dan. Me also knows Dan not known as Chunks - fer one ting,
Dan's actchooly not got a weight probelm as you claim he do. Second, how
can Dan have sexual appetite when he no practice it? Thirdly, why you
attack Dan about dese tings when it obviously off topic? Could it be yer
tryin' ta project yer own stinky problems onto him? Could it be yer
tryin' ta distract people from relaizin' how much a moron ya really is?

Lets take stock of this right now. Has anyone here in the atari groups or in mac groups (that you never post in, yes I've checked) ever agreed with you? NO
Has everyone you've ever communicated with in this newsgroup or any other called you a brain dead idiot? YES

Btw, since your American (which is acceptable on its own) and Incredibly Stupid, in fact the Taliban would either laugh at you or at the very least insult your lack of intelligence.

>
> Care to back this up. What have I stated that is crap?
>

I don't have to back up the fact that your an ignorant liar. You do such a good job of that yourself. Such as your blatant lie in this very post that your an Atari user. Take a hint, atari users don't spend their lives bashing atari computers and other atari users.

Theres also your bogus claim to attend tradeshows including Macworld in NY and SF. Despite the fact that you've never been seen there by anyone. The mere fact that you can claim to be there and be totally invisible to the thousands of attendees is absurd to everyone but you.

And lets not forget your laughable attempts to delude yourself that you want to be an "apple power rep" in your professional capacity even after its been proven many times that you've never worked for Apple or any Apple dealer.

You see, it goes to your own credibility. You make wildly stupid accusations against others. Then you contradict yourself. To top it off you wont provide evidence when pressed repeatedly. The result of this is you're universally recognized as an utter fool.

> Whats there to post? It's an advocacy group too, plus I am a Atari
> user as well.

You an atari user? absolutely not. you've disproven this many times with your egomaniacal diatribes bashing atari users over the years. Yet you continually claim to be a mac supporter. This is not born out by any facts, in fact your own statement above proves quite the opposite.

"whats to post?" you ask? despite your claims to being an apple user you never venture into any of the mac newsgroups defending apple from the mac bashers who spew the same

idiotic BS that you mindlessly fire off at Atari users.

The facts are that your simply trying to inflame people against each other. But your silly little school yard bully plan is foiled by to blinding facts. (1) Your stupidity is so obvious and self contradictory that it invalidates itself (2) More than a few of the people you bash are at one time or another people who've used both Atari and Macintosh systems. In essence your attempts to provoke Mac and Atari users against each other are attempts to get people to attack themselves.

Good luck! I wrote to them asking if they would consider releasing
Prospero FORTRAN for the Atari ST as freeware, which they apparently
still develop on other platforms. They said that they had no
intention of releasing the Atari version as even freeware because it
made them look bad. They didn't want to be seen by others as less of
a serious company for giving away their products for free.

Don't ask me why they would think this, that's just what I got out of
their e-mail. I can try and dig it up sometime and post it here.

Hi Atarians

A small thing that has been "bugging" me for a while which I know some one out there knows the answer too. I`m sure I have read it myself somewhere but this old brainbox is getting well past its sell by date.

I have a small programme (4.7.11 in fact) as a ACC which helps while away the time during the middle of the night, I being well beyond normal nightime activities !!. When closing the prog down the screen is inverted.ie white becomes black and black is white.This means having to reboot to use my normal setup,a pain at times.

Your help gratefully accepted.

To be specific, the web page is

http://www.templetons.com/brad/alice.html

And it's in ftp.templetons.com/software/ either alice-atarist.zip or
alice1.st and alice2.st for the original floppies.

Note that the documentation is for the PC version, which was a DOS
command line based tool, while the ST version is much better with
full GEM support etc.

But I don't have the ST manauals around in a format I can easily put
on the web, alas.

Although he's quite capable of speaking for himself! :-)

If I could only get this system error sorted out I would be testing out
all my ANSI Pascal programs I have done in the past at college. Nobody
got a COBOL compiler? On second thoughts don't bother!

Glad to bring good news to this newsgroup for a change.

Regards

Neil :-)

Hello,

I've got a mono replay 16 which plugs into the cartridge port on the side of
the atari.
£25 including postage and packing.
Anyone interested.
Please e-mail me.
Cheers,
Andrew

Hi Chris,

Smeg it bugs me when these things happen. I'd lke to arrange something with you cause I can probly arrange to host some of the files on my site(s). email me and perhaps we can arrange something, or you can find me on icq, you got my number on there.

Most likely you are refering to the option that enables/disables the
SCSI driver. Note that since HDDRIVER 8 this option is not present
anymore. The SCSI driver is always active because HDDRIVER uses it
internally all the time.

Hi james,

The files on my site really do add up to a lot of megs. I can relink the pages to a new URL though its a lot of work. I dont want the site to go but im really am sick of spending months uploading files to servers which die after a year. If you have a few 100mb of webspace going then i can send you the site files on CD if you have direct access to the server to copy them to it.

Chris

Hi Olivier!

>I'm looking for help on how to use Deuteros. I don't find the
>way to take after having conquered the solar system.
>I someone remember something about this game, please answer
>by mail.

It's possible that you haven't conquered the solar system, try sending a ship (well more than one would be quicker!) to systematically search every planet and moon, there may be a Methanoid base somewhere that you've overlooked.

I seem to remember that the game would only go onto the next stage after some time had elapsed after the last base was conquered.

However you are only half way through the game, the best bit is next - there are other solar systems to explore! :)

If you get stuck, email me, and I'll see if I can remember more.

Cheers!

James

I suppose you could write to UDS, they're still in business, though their offerings nowadays tend to be children's games for the PC. Isn't it hideous how the developers of such great grown-up games have detoriorated into that kind of business? I suppose it pays off, but any serious gamer wouldn't even pay the slightest attention to "Mulle Meck". =/
But I think it's time to release Obsession for free now. Digital Illusions have done so with their Pinball range.

I don't think so. Paul Newman played Luke, a convict on a chain gang.
Strother Martin played the warden of the prison.

Didn't they do "NO Fear downhill mountain biking" which was pretty good,
it was on the Playstation but I would have imagined there would be a PC
version.

Not much help/use to Atari users I know but I think the problem can be solved for those also using PCs by upgrading the modem from v90 to v92, apparently the upgrade software is available from the website of your chosen modem manufacturer. It's also supposed to half the speed taken by the modem to log on amongst other things.

I'd suggest before you go for the trade, go over to the Low End Mac
web site (http://www.lowendmac.com), it's a great repository of info
on all older (and new) Macs, and it can tell you about features, specs
and what to watch out for in the way of problems and upgradability.
There are some Macs that have even been given the badge of "Road Apple"
for certain flaws.

My own experience: when I began looking at used Macs, the guys at the
company I bought it from suggested that, for a PowerPC model, to skip
the 601 series of processors and go for a 603e-based model, as the speed
difference is quite dramatic. The 603e and later 604e models have the
advantage also of being PCI-based, so your ability to upgrade the video,
add USB or Firewire, etc, is assured. Also be sure to go for a model
which puts the CPU on a daughtercard, as you can then later change it
for a G3 or G4 CPU.

For the record, I'm currently using a UMAX J700 (from the clone era,
it's the equivalent of a Mac 9500 minus two PCI slots, though there is
provision on the motherboard to add them for a total of six) to which

I've added a PowerLogix 350MHz G3 card. At $399 CDN, it was not only a true bargain, but it was also my way of thumbing my nose at TiFKAS :)

Oh, and to keep it on topic to the group - Low End Mac also happens to have pages dedicated to the ST and to the STacy, due to the ST's ability in the day to emulate a Mac using Magic Sac and Spectre. Dan Knight knows his stuff, and he's a class act.

Derek, have you tried to go ControlPanel/ColorSetUp [1] and click Reload
(at bottom right of panel, if you can't see it yet)? That should do it.

[1] Or whatever name it has: mine is COLORVDI.CPX v 2.10.

Charles.

4048. Creating TGZ file

Newsgroup: comp.sys.atari.st

Hi All

AEX now available: New Midi Instant Tangerine Dream machine

OK...got the AEX page completed so have a look.
Pic was provided by the Dr ! Thanks!

For those in the dark, AEX is a new application (still in beta) by Dr Ambient that is an "instant" Tangerine Dream Machine. very cool!Simultes Analog Sequencers with an intelligent twist. I had the pleasure of beta testing.

The AEX page and download:
http://tamw.atari-users.net/aex.htm

There is also a special version for TT-HI users (the 19" monitor on a TT030)
There is also a link to Dr Ambients MP3.com page where you can hear what AEX sounds like in the piece called "Pilgrim" based on the Robert Service poem.

AEX does work in STEem, but with some changes in the key commands.

I also did some changes (a little) to my site. The index now has the intro
section on it so you don't have to do so much scrolling on the main (timidi.htm) page.

here is the index page:

http://tamw.atari-users.net

I would invite comments

Tim C.

>GZip.ttp? I have tried with no luck.

If everything is set up good this command will create a tgz file for you

tar -zcf [archive_name.tgz] [name of file/dir you want to archive]

tar.ttp -zcf k:/chapelie/funmedia.tgz k:/funmedia/*
tar.ttp -zcf k:/chapelie/index_all.txt.tgz k:/progs/index_all.txt

Not sure though this methode will work with the TOS version of tar
and gzip. If not use the following:

tar.ttp -cf [archive_name.tar] [name of file/dir you want to archive]
gzip.ttp [archive_name.tar]

e.g. tar.ttp -cf test.tar test.prg
gzip.ttp test.tar ---> test.taz (=test.tgz)

7500 Macs are going for only about $100 now in the US. I've even seen
7300 with 180 to 200 mhz 604 for not much more, like $120 to $150.

Isn't a 68040 Quadra with MagicMac still a lot faster than a TT? I've
been trying to buy MM in the US but can't seem to find it here. Someone
at support@magical-sides.de have a website advertising it as available
in the US for about $90, but my mail to them has not been answered.

4053. HDriver-JAZ 2GB

Newsgroup: comp.sys.atari.st
Date: 2001-10-14 05:12:34 UTC
From: dwolfe@netcentraltv.com
Message-ID: <9qb6s1koe1@news.chatlink.com>
Source record: 41424

I have 4 partitions on a JAZ 2GB removable disk (GHIJ) H was giving me some write errors so I moved all wanted files from the disk to other disks. I checked the drive H: with HD and it showed bad sectors, so I decided to let HD reformat the plater.

The program said the process could be several hours, so I started the formating and left the room for 2 hours, when I next checked the disk there was a message that it could not format the disk, so now when I try to partition this disk the message is: Couldn't Read Root Sector of G:

Question, is there any Utilities for repairing the Root Sector as before the formating partitions G,I,J where all good... Any Ideas ??

Thanks, Donner.....

Don Wolfe wrote:

> Question, is there any Utilities for repairing the Root Sector as
> before the formating partitions G,I,J where all good... Any Ideas ??

No, there isn't. With most drives the root sector is only accessible
after the drive could correctly terminate the format process. This was
not possible in your case, i. e. the damage on the cartridge is so bad
that the JAZ was not able to format it. Try to format it a second time.
If you're lucky, this will work. If not the cartridge is simply damaged
and cannot be used anymore.

Message-ID: <3BC94FB4.BFEC4A5C@student.tudelft.nl>
Source record: 41426

Hi,

yesterday I installed a MagnumST card into my Mega ST1. This
is a board that goes on top of the MC68000 and upgrades the
system to TOS 2.06 and also expands the memory with 4/8/11
MB, depending on the size of the SIMM you put onto the
board.

Now I have the following problem: the TOS 2.06 upgrade works
fine, but if I put in a 4 or 8 MB SIMM, the driver
MAGNUMST.PRG recognizes only 512kB :-(
What might be wrong here?

BTW. I got the driver from http://www.uweschneider.de/

regards,
Dennis

Does it have a wire from it conected to one of the ACIAs? If so I have a
program that would turn it on and off, proabably. I've never understood
why they only ran at 36MHz when the Nemesis/Phatom can run at 50MHz.

Thamks for that Charles. Yes I have tried that amd clicking on
Reload does indeed return to the original colour BUT the next page
brought up is again reverted. In other words the only way for me
to have my orignal setup is to completely reboot.

Thanks again

If you use the MiNT utils you only have to do one action.

tar -zcf /k/chapelie/funmedia.tgz /k/funmedia/*

The -z command tells that after the file/dir has been TARed it must be
passed through gzip

To unpack *.tgz file use this:

tar -xzvf [file.tgz]

Here again the -z command tells that the archive must first go through
gzip and then through tar.

correct, however a G3 daughtercard replacement will already have an
L2 cache onboard (built into the G3 chip itself), so you'll gain one if
you buy a 7500 and install the card. On my UMAX, my L2 cache became an
L3 cache when I installed the PowerLogix card.

> The 8200 on the other hand has an L2 cache, but doesn't have the
> better memory performance because of the interleaving, and is a pain to upgrade
> to a G3 (although I've heard of a recently available G3 card for this
> machine as well). Correct?

The Sonnet 7200 card? It's an amazing feat of engineering, but it's
also very prohibitably expensive, especially in the light that Sonnet
makes daughtercards for the 7500/7300/7600/8500/8600/9500/9600 which are
MUCH cheaper.

> Well, as I said I don't want to spend much money on this (actually I

> additional DIMMs which will be a cash outlay for me (hopefully not too
> much, but worth checking out before I go ahead with this as I can't use
> the memory I have in my Quadra)

thankfully in the case of RAM for these machines (168-pin EDO or FPM
DIMMs) there's been a price war going on in the US since April, with a
number of companies dropping prices of generic and some branded RAM
(Kingston, I believe). 64MB RAM sticks of this type have been going
around $25 each - earlier this year they had been going as high as $119
US each (ouch!).- and 128MB sticks have been in around the $34-45 mark.

> but as far as upgrading goes I don't think I'll ever get the required capacity for
serious video-editing in
> any case, and if I do I'll probably have spent more money than buying a
> G3 or G4 Mac in the first place. (I imagine those machines having a generally higher
overall performance
> than any "G3 upgraded" older Mac will ever have).

correct, as the new machines benefit from a much faster bus speed,
and can utilize much faster PC RAM. Plus they also have Firewire built
in.

> Getting back to the 7500 vs 8200 again: I see that the 7500 uses a
> "desktop" case, while the 8200 uses a "tower" case much like my 840av. I

> But from what you've said so far it looks like it will be able to
> replace the Quadra and more, so the trade is a good one (if I can find
> some cheap DIMMs).

in that case, why not consider a "select pre-owned" :) 8500 or 8600,
which are the same form factor as the 8200 but have the daughtercard
replacement option, as well as the faster 603e and 604e processors . Of
course, do realize that the 8500 and the 9500 have the reputation of
"fighting back" when trying to install RAM and other upgrades, according
to MacAddict.

You'all make me ashamed to admit I acquired a second hand MacPPC 6100 last year. So far, it seems useful only for the Internet (via AOL, iCAB or IE5) colour printing (DeskJet 660C) and Appleworks6 (which I'm just starting). It does have MacOS 9.x.x, which is kinda slow, but no upgraded RAM yet.

I still use my TT every day, so there! :)

Charles.

I converted my Falcon LAN port to a standard RS232 port. It was a simple
task and I really must put the info on my website but I feel I forgot
where I put the wiring I devised.

Hi All

Looks like my LUDWIG article is UP. What is Ludwig? Read my article
and find
out.!!

There are also example midi files as well as the actual program
download.

MyAtari also created a cool logo for my colomn. Rather neat!

here is the link:

http://www.myatari.net/issues/oct2001/ludwig.htm

I would encourage anyone here to write an article for My Atari...Its
OUR magizine! Lets show everyone that Atari is NOT DEAD!

Tim Conrardy

4073. LAN port pinout on TT030

Newsgroup: comp.sys.atari.st
Date: 2001-10-15 08:41:27 UTC
From: Alan Hourihane <alan_hourihane@hotmail.com>
Message-ID: <1003135289.3701.0.nnrp-07.9e9834fc@news.demon.co.uk>
Source record: 41444

Has anyone got the pinouts for the LAN port on the TT030 ?

Or has anyone connected it to a PC successfully to zmodem things
around and can show the cable they're using ?

Thanks.

Alan.

The cable is a rather standard one, usually sold under the name "Mac modem cable". It's traditionally used to plug a standard modem into a Mac.

Another alternative, if connecting to a Mac or Sun computer equipped with an RS-422 interface, is the "Mac printer cable" which can be used as a nullmodem cable.

More TT030 trics at the URL below.

Yep, I've got one, but it doesn't work, and I'm trying to understand the TT
port to understand why it's not working. Aparently the TT doesn't have some
of the control lines. So I could really use the port pinout info if anyone
has it.

Provided the card is OK (I know some which were manufactured by a
sub-contractor had soldering problems, especially at the PS/2 socket), it
might be you got a SIMM with asymmetric (unequal # rows/columns) DRAMs. The
MagnumST does not support these - although they were not very common in PS/2
style.

Do you have a chance to try a different SIMM?

If the TOS on the Magnum works, then the installation is most probably
correct.

On 14 Oct 2001 09:54:17 , Galen wrote:
>Kindly remember to post your experience, as that device sounds quite useful.

Certainly will! There hasn't been any progress to report until today,
as the cable has only just arrived. However....so far so good.

I don't find the HDDRIVER manual particularly helpful, so I was unsure
how to go about installing the SCSI reader. But after playing around
a bit, I used Auto Configure and then Install Devices from the
desktop. It added a new drive H to my desktop, so I assume this is the
card reader!

If I double-click on it, it doesn't open up, but I assume that's
because I haven't yet got a CompactFlash card in it. My Syquest drive
does the same thing when there's no cartridge installed. I'm hoping
to borrow a card tomorrow to test it out.

One strange thing is that no matter how I set the dial on the reader,
it always shows up as SCSI 2.0. The dial has a total of 14 positions,
0 thru to 7 for both terminated and unterminated. Does this point to
a faulty unit?

Also, it shows up as having two LUNS - SCSI 2.0 and 2.1. What exactly
does this mean, and does it affect anything? Calling all SCSI bods!

Good News, Uwe, Lyndon, Gamer;

Thanks for all the great information.. I reformatted the 2GB platter the second time with the same results (Can't format this Disk). I decided to try it one more time, well the third time it worked like a charm the disk came out clean and checked out with no bad sectors.:)

I may have been doing it wrong the first 2 times, the third time I clicked on the Box "Ignore Current Defect List" which maybe should have been done the first 2 tries ??

Now the big Question is: What caused the write errors in the first place is it a Bug in the operating system or is it just Murphy's Law ??

Thanks again, Donner......

This should not really have been necessary.

> Now the big Question is: What caused the write errors in the first
> place is it a Bug in the operating system or is it just Murphy's Law ??

This problem had nothing to do with the OS or any other software. SCSI
drives do formatting completely on their own, as soon as they get the
SCSI FORMAT command. So if something goes wrong like in your case the
drive itself had problems with the cartridge.

From: Ove Peter <ovepeter@gmx.de>
Message-ID: <3BCC17FA.FD309173@gmx.de>
Source record: 41360

Hi!

I just want to add to this discussion that the 8200 Mac isn't a good one IMO. That's because it has an 601 CPU and even worser, NuBUS Slots (so NO PCI!), which means it's slow and not really upgradable, and it doesn't run BeOS, hehe.

So it would be cool if you could convince the collector to give you a better Mac model for your Quadra, maybe with some extra money. If he does not want that, it seems like a good trade-in nevertheless for me from what the people here said about the performance running 68k apps.

Personally I only have a 6100/60 with a 601 CPU and NuBus, and it runs MacMINT / MagiCMac VERY slowly...

Some IMO good Mac models are: Performa 6400, PM 8500, 9500, 7300, 4400 and the UMax clones.

Cheers,
Ove

OK, limited success. I've borrowed a CompactFlash card today to test out the ADtron reader.

First of all, the new H drive on my desktop wouldn't open when I double-clicked on it. Whent here wasn't a card in the reader, it wouldn't do anything. When a card was in, I got a dialog box "Drive H does not exist". I solved this by switching the reader on and inserting teh card *before* switching the computer on.

After that, I was able to open the drive and it displayed a folder called DCIMAGES and in it were 4 JPG files. I copied them to my own hard disk, and I was also able to write another file to the card with no problem. Looks promising.

However, Imagecopy won't display the images - it says "Cannot read <flename>". I get this from time to time with images I've downloaded from the net. It seems it's a type of JPG that Imagecopy doesn't recognise.

CAB usually displays these files, so I tried that. But I just got [IMAGE] on the page which usually indicates there's not enough memory to decompress the image.

So I suspect it *will* work if the images are saved on the camera in a smaller size. They're probably at the camera's highest resolution.

Just trying to find a program that will load them! Failing that, I could take the images back into work and re-save them in Paintshop Pro - this usually sorts out the Imagecopy problem.

That picture is unusable. I've tried all the Atari apps I've and Graphic converter on the Mac. The format is faulty.
That's what graftool says about the file:
Skipped 148 bytes before marker EE
JPG_ERR File does not start with JPEG SO1 marker

Mmmm, I'll try and avoid *that* camera then!

Unless of course the card reader/SCSI/Atari connection mangled it on
the way through...

But on that subject, is it quite common for Imagecopy not to be able
to recognise a JPG file that CAB can handle? I'll try to remember to
post an example when it happens again.

Chris,

Microsoft's IE will not display the image either, so I suspect it's
faulty. Can you try reading and writing some large ASCII files? Then
you can use a file comparer to see if the file is writing without
corruption.

Galen

Chris,

How large is the card? If it is over 32Mb, you may need something
like BigDOS (then again, you may not).

Thanks for help with mouse, I gave it a clean and it seems a bit better, but will bear the other advice in mind.

Now I am wondering if

1 - I can attach an SVGA monitor with an adapter without any drivers, cards etc. (as advertised at Atari Workshop)
2 - How can memory be expanded - I have various SIMMS, 30 pin and 72 pin.
3 - Can I use an old AT case to house a SCSI drive, use its power supply, and use an adapter cable to link up.

Would appreciate links to sites that can help. We are housing 5 or 6 other systems, and they all want feeding, so I'm trying to do this quite cheaply.

It's only an 8MB one.

I will have to give the card back tomorrow so I can't do any more experimenting with it. Don't know, it's a bit confusing really. The only thing I can do is to try and borrow another card from a different camera. When I come to buy a camera, I'll have to ask the shop if I can borrow a card made with the camera to see if it will work.

I think Mario Becroft in new zealand also has a device that could do this for you. I can't remember his website url at the moment but hopefully someone else here does.

>
> 2 - How can memory be expanded - I have various SIMMS, 30 pin and 72 pin.

What model of ST you have (I didnt remember your original post so I don't know). Some such as STe models use standard 30 pin simms up to 4 megs, ST, STf and STFM models will need an upgrade board that takes either simms or the older rams (dip style). I've seen some TT and Falcon upgrades that use either 30pin or 72 pin simms.

> 3 - Can I use an old AT case to house a SCSI drive, use its power supply,

Yes, all the parts are standard plain vanilla scsi parts for this, except the host adaptor for the atari, try a search engine for Link96 or Link97. Or you may find an older model for sale used as well. Uwe Seimet who posts here regularly has a commercially available program called HDDriver that is the latest in HD software. I find it to be very fickle to set up but it is usable. Btw, if you do find Mario becrofts site, he also has an IDE host adaptor for ST's

Sure, but this shows that the qualitiy of the media is not the very
best. Or the quality of the drive. A removable media drive that cannot
format media properly is not what I would can reliable ;-).

Yes, I don't know *how* exactly it is called ("progressive jpeg"?)
but there is one type of jpegs that Imagecopy and Papillon cannot open.
You may open them with 1ST-Guide (just to see what it is) or in Smurf
(to save it in another format).
BTW I thought CAB 2.7 cannot handle them either...?

I've now tried it in work with Paintshop Pro (which usually works with files that Imagecopy can't read) but that fails too.

> Can you try reading and writing some large ASCII files? Then
> you can use a file comparer to see if the file is writing without

I tried writing the HTML 3.2 specification in a text file to it! (Over 100K, so it's bigger than this picture). It came back perfectly, to the eye anyway as I haven't got a file comparer.

It's very fast too actually. Quite impressed.

Hmm, I'll try and look in the camera's instruction book to see if it
mentions what type of JPG it saves.

> BTW I thought CAB 2.7 cannot handle them either...?

I've got 2.6 I think - all I know is that when Imagecopy refuses to open a
JPG, CAB will.

Hello Michael,

Thank you for your advice!
I checked the MagnumST card's connectivity from the PS/2 socket to the card (with an ohmmeter) and that seems to be OK. The TOS on the Magnum still works fine, too.
I also tried 5 different SIMMS (4 and 8 MB types) which I got from a friend, in all cases only 512kB of it is found (but I can load programs in that 512 kB without problems!).

Could it be a problem with the socketed chip on the board? I have a spare one for replacement.

Dennis

4109. STNICCC 2000 Site (including Atari 16-bit Scene Central)

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

If you're running HDDriver, try using the bus rescan feature in HDUtility
before re-reading the card. If you're not, then try running Steffen Engle's
SCSIDRV.PRG. It could also be a media change problem, so MEDIACHG.TOS could
be the answer.

Try using 1STGUIDE. It displays jpg's from my camera just fine.

Chris, I suggest you download Egale. Contact the author:
david_reitter@wi2.maus.de
for details where you can get it from, then send him the 30.- DM
shareware fee (under 10 UKP) to unlock remaining features.

I find it *very* useful, not just to compare individual files but
even whole directories. You can even use it as a binary editor.

Regards, /Peter/

This may be a bit of topic drift but I've always liked the Syquest
removables. I find it a bit odd that they never became more widespread.
They were and are quite usable on atari systems at that.

Source record: 41390

Hi,
I have following problem: One program wihch I made in '93 now exists only as
a file for GFA Basic 3.0x or something similar, but I do not have Atari ST
or GFA basic for convert it to ASCII.

Can anyone help me to transfer a program to ASCII listing?

Thanks,
Boris Cinkler

I had good service from two Syquest EZ135 drives, but don't waste your
money on the SyJet drives. I had three of them, all three turned to
junk in very short order. They could never be relied on to read or
write a cart. SyJets were a complete waste of money and probably what
drove the last nail into Syquest's coffin.

I'm still using the Syquest EZ135s, along with a Yamaha CD-R drive now.

Hiya,

The user group I've been in had quite a collection in its library.
Although the club itself is for all purposes quite dead, I'm working on
producing a cd-rom of the collection that the club librarian and myself
will be making available with all the clipart we could find on it, most
of will be img format if I remember properly

This is possible with HDDRIVER. Note that this is his only choice since
other drivers for the Atari do not support IDE drives larger than 8 GB.
Also note that using MagiC or MiNT is a good idea for such a drive
because TOS cannot use more than 14 GB (1 GB per partition).

The 270 MB drives were a real pain. A lot of them did not work properly
and I guess that is one of the reasons why SyQuest had to close down.

I have never heard of this?? Sounds strange as as long as you use the isp
newsserver from the isp "LAN" area (dialup etc...) they know who you are
anyway. Check my header with ip address etc. as an example.

If you post messages from somwhere else than your isp address space some
other identification is very important to avoid spam etc.

>Does somebody know how I can do this with Newswatch?

Newswatch is supposed to support this, yes. I have never tried i it
really works, though.

Visit page http://www.bright.net/~atari/html/gfa_apps.htm and use "OUR
NEXT STEP - The GFABASIC4 development package v0.00.a.pl1"
It convers GFA files to LST (so convers to ASCII).

At work we have the usual NT 4.0 network with HP LJ 4 printers. We use an Atari ST for running a small inserting machine and it has a report that we can generate with the usual dot matrix printer but it takes forever and the paper is always jamming in the printer. I would like to take the data disk out of the Atari and put it in the nt 4.0 system so I could use the Laserjet to print the reports. Is there anyway that I can do this?

Ask the European government. The new European law is not operative yet
but as usual the Belgian government has decided to be the trendsetter.

And yet, it's true. The European law is not effective yet but the
Belgian government didn't wait until the Eurpean law will become
operative.

Directtly after I've posted my first message I noticed Newswatch
supports User Authentification. Alas it seems not to work at all. The
newsserver refuse to send out messages (authentifications failed)

If you can persuade whatever program that you use on the Atari to print your
reports from to print to disk then yes, you can.

Have you considered using a printer switch box so you can print from either
computer, or does the network setup preclude this?

Do you know what format the Atari file is in?

If it is plain ASCII text, you could easily open it in any IBM
wordprocessor to print to the network printer.

If it's NOT a plain ASCII text file, possibly the Atari application
can be told to save it as plain ASCII.

If that's not possible, and the file is in some proprietary format,
then you may have a problem.

If the problem is simply getting the IBM system to READ the Atari
disk, the simplest way to solve that is to FORMAT the disk on the IBM
system.

You must format the disk as a 720K Double Density disk (there should
be a way to select that option in the NT formatting dialog box),
assuming the Atari disk drive is a Double Sided drive.

If the Atari disk drive is a Single Sided drive (360K), then you must
use a special Atari formatting program to make the disk MS-DOS
compatible so the NT system can read it.

A couple of questions-

What model is the Atari ST?

Does it have an external floppy disk drive, or is the disk drive
internal to the computer case?

BobR

Probably. Try double-clicking on the report file from the desktop --
if it is readable you can just put the data disk into your Windows
computer and print from Notepad. If not, you will have to rely on
emulation, which works for the vast majority of programs. Try
Gemulator at www.emulators.com for a copy of one such emulator.

Galen

P.S.: How does the Atari run the inserting machine?

Agreed. My two Syquest EZ135s have never given me the slightest
amount of trouble. I still use a SyJet, but it is a bit tricky
getting it to start up, and I only use it for temporary space for
copying CDs.

Chris,

If you are able to move files to and from the card, it is very likely
that any similar type card will work (at least, up to 32MB -- larger
should be possible, but might require some extra effort). My
understanding of the digital camera industry is that if the
CompactFlash card works, any CompactFlash card should work.

When are you going to get your camera?

I have a 20G IDE on my Falcon. Using HD Driver 8 I formatted it as
10 x 2G partitions.
(I also use Magic I can't remember if that's relevant)

Hi Kenneth

```
Naah, don't think I will start messing around remapping, just because
one letter comes out wrong for some people. Since I never use Newsie
for posting in swedish groups, I don't think it's such a big problem.
And Okami..., I know you like it, but I cant be bothered with the
setup, and I'm always reading and posting while online, so I can't
see the advantage in using Okami, except for character-coding.

Sorry if this posted twice!

Hi All (and Uwe if your here),
Is there a compatibilty difference between HDDriver 8 and ICDboot?
I'm trying to get Magic to run with ICD but will only run with HDdriver.
But if I run HDDriver, it's seeing 4 x 250 meg partions instead of the
8 x 125 meg partitioned with ICD!
I did have Magic and HDdriver running ok at one time but had problems
with Cubase so I went back to ICD and no Magic. So now, in going back to
HDDriver, there's the problem!

Thoughts welcomed!

John G.

Hi,

I have atari STe (with 4mB RAM, but no HD) and a PC running Linux Mandrake
8.1
Is it possible to connect them together via the serial ports to allow the
atari to access the PCs files and internet connection? If so, how would I
do it?

Thanks,

Yes you can do it!
In all cases you need a nullmodem cable.
The easiest way is using a terminal program on the ST end and a getty on the
Linux end to achieve a console login.
You can login to your linux box and use lynx, w3m or other console based net
clients.
You could try to setup slip or ppp for local use on your linux box and run
STiK or compatible internet connection software on the ST. And with 4megs of
RAM on the ST end, you should be able to operate it without a harddisc.
Use a ramdisc instead.

However these are only suggestions. I only have reliable information about
the first way which means using a shell account on your linux box.
Take a look at the latest issues of the Linux Gazette to read my article
about the first solution.

Note that there is not operating system for the Atari that supports
TOS-compatible partitions of more than 2 GB. TOS 4.0x, for example, has
at least one known bug that prevents TOS-compatible partitions of more
than 1 GB to be used.

That's a known issue MagiC and ICD will not (always) work as far as I
know.

> But if I run HDDriver, it's seeing 4 x 250 meg partions instead of the
> 8 x 125 meg partitioned with ICD!

Note that the ICD default partitioning scheme is not Atari-compatible if
there are more than 4 partitions. You have to convert this incompatible
scheme to the AHDI compatible scheme before any other driver than
ICDBOOT can recognize all partitions. The software ICD2AHDI by Thomas
Binder will do this and is included in the HDDRIVER distribution.

Did you partition the drive under ICD with AHDI compatibility on? If not, this
could be the source of your problem. There should be a utility on the
HDDriver master disk to convert the partition type (back it/them up first).

I've heard that from another Mint+NAES user. I got that Runtime error
first time I tried to load a PDF but next time I loaded Porthos up it went
away. It runs OK under Magic but I imagine these kind of bugs can be
sorted out by the next release.

Without the floppy disk working there is nowhere to store your image. You
could dump it via serial port but then you still don't have software on
the machine to write the program to do this. The only way would be to use
an EPROM reader.

>MagiC 6.10 FAT32 -> Terrabyte (not MagiC 6.01) !!

DOS comaptibility is the TOS/DOS option in HDDriver right? Does this affect speed, integrity or which program to defragment with? I use Optimise and I also use TOS/DOS on one Zip disk but I've yet to try to defrag it. Does the boot or root sector just get changed when it's been partitioned to TOS/DOS?

Hi Alan!

>Wouldn't anyone like a PPC in their TT ?

I would have thought it would be quite easy to make an accelerator for the TT. It has fast 32 bit bus so all you need is some cache , cache controller and PGA 68030 and run the whole lot at 75MHz. Then just use waitstates to access the TT or slow the CPU down. It would be like the ADspeed or those T28/36 accelerators but just for 32bit design. I don't have a TT though but I'm sure that would make it very fast, I would have thought faster than a CT2 Falcon.

>
>

James,

I had some experience of printing out some ST based documents on a NT 4.0
machine.

The documents I was printing out were Pagestream documents which I couldn't
get exported
into some Windows based program.

What worked for me was to use an emulator called TOS Box. I've found this
emulator works
great for running ST application programs. Once you have the emulator
setup, it's just a matter
of getting the application you need to run installed onto the emulator's ST
hard drive (simulated).

The good thing about TOS Box is that you can see all the other drives and
files on the PC. You
can also use the floppy drive to read a ST disk and have a image of it on
the emulated ST
desktop.

Like I said above, I was able to run Pagestream, load up the documents, and
print them out
in post script to my Apple Laserwriter Select printer under Windows 98SE
(and also on another
machine running Windows NT 4.0 and a HP Laserjet III).

I hope this is helpful.

Now if I can only find a Falcon emulator?

I have information on how to run a ppp link over a null
modem cable on my site here:

http://jybolac.virtualave.net/aff/readme.txt

This readme is really about how to get Floppy Firewall
running with the ST, but there is good information about
running pppd on Linux in order to connect as well.

Basically under linux you need to run this command:

'pppd ttyS0 115200 192.168.100.1: crtscts passive noauth persist'

The "115200" is the baud and may need to be adjusted for
your STe. The "192.168.100.1:" is your linux box IP
address and should be changed to match what you have setup.
The atari IP address can be anything as long as you setup
a route and do IP masquerading for that IP address.

Download this:

http://jybolac.virtualave.net/aff/afloppyf.zip.

It includes a Sting configuration that should get you
going.

Sometimes the ppp daemon dies before connecting to the
atari, so you may need to run the pppd command and
imediately run Sting. If the pppd dies, re-start it.

Let me know if you need help with any of this, or if
you need help with getting ip masq or route stuff working.

??????? I don't understand your problem. Normally in Two-in-one you can
choose the extracting folder (right window) so...???

I can't help you with Two-in-one as I don't use it anymore. Too much
troubles with Long files names etc..
There is another program though that can extract .zoo files, ARCVIEW.
This is a brand new shell for the most common packers on the Atari
platform such as *.ZIP, *.LZH, *.ARC, *.ARJ, *.ZOO, *.TAR
It works on all platform with every OS but it needs w_dialog.
Very neat program.

Jelly Bean <judi@redlion.demon.co.uk> skrev:
: Thanks for help with mouse, I gave it a clean and it seems a bit better, but
: will bear the other advice in mind.

: Now I am wondering if

: 1 - I can attach an SVGA monitor with an adapter without any drivers,
: cards etc. (as advertised at Atari Workshop)

Yes. I did it by cutting off the monitor cable from a broken SM124 and
then connecting/probing the wires at random to a female D15HD connector
into which the SVGA monitor's cable is plugged.

: 2 - How can memory be expanded - I have various SIMMS, 30 pin and 72 pin.

If you have an STe, 30-pin 1 MB SIMMs will bring you up to 4 MB. Beyond
that, or if you've got a plan ST/STF/STFM, it gets a whole lot harder.

: 3 - Can I use an old AT case to house a SCSI drive, use its power supply,
: and use an adapter cable to link up.

Yes, PC cases make excellent, albeit ugly, SCSI boxes. But you need a SCSI
interface for your Atari, of course. They're built-in in the Mega STe and
TT, but since you don't state what model you're using, I can't give you
further advice on that matter.

Whew! It's been an exausting few days, but I've managed to change the look of the site. I've also spend a lot of time going over all (most) of the pages to make them look better.

Content-wise, here's what's new:

* NEW! Find The Secrets! Win prizes!
* NEW! Challenge of Nexar for the 2600
* NEW! Asteroids Theme implemented! More on the way!
* NEW! Review and Feature pages added

* Revisit the Steel Talons for Lynx review

Don't forget, TAT is YOUR Online Newsletter! It's only as good as YOU make it! So make it good!

Hello all,

You remember when I reported that my CD drive was noisy? Well last night it was REALLY noisy. I took it out and looked at it and found that the noise was coming from a little fan. It was on it's last leg and fell off. Now the drive is as quiet as a mouse. Is it all right to run the drive without the fan? I tested it out and it runs and functions great. Should I look for another SCSI drive?

Yes you're right. There is an option indeed but under freeMiNT/N_AES
this seems not to work at all. First I thought this was a demo
restriction but as it work under MagicMac this must be a bug.
Furthermore it's impossible to view a pdf file under N_AES. If I try I
get a Runtime error 213 at offset $0008540A.
Another strange thing is that when I use Freedom 2.05 as fileselector
Porthos keeps saying wdialog isn' started. Wdialog is in memory as I can
use for instance arcview and Phototip.

Hi John,

JG>Can ICD2AHDI be used without loosing data already in the HD ?
yes, but IIRC the manual (readme) recommends to have a backup prepared
before the conversion!

Quotation:
Man sollte bei wichtigen Daten allerdings trotzdem ï¿½berlegen, ob
es nicht sicherer ist, von der Platte ein komplettes Backup zu
machen, um sie dann komplett neu zu partitionieren.

The author's email address (maybe not recent!) is given in this readme.

Hi Derryck,

Could be that I did'nt turn on AHDI compatibility...don't recall!
Thanks for the advice (especially on backing up the drive). I have a
cheap SCSI drive from E-bay that I use as back-up. It's come in handy more
than once! But just to be more certain, does the conversion cause loss of
data or are you saying to play it safe by backing up the drive?

Never heard of Two in One but many years ago I used to use zoo a lot (Back in the Atari days). If I remember rightly, it stores the relative pathname of the file being archived and will restore back to that path irrespective of the location of the .zoo file

i.e. if the original file was - c:\directory\subdirectory\file

then it will extract to - currentdirectory\directory\subdirectory\file

Hi

I have a 4mb Mega STE and I would like to upgrade the 80mb internal drive (connected to the internal Atari interface).

I've already read that the drive must be capable of having parity turned off. But does it matter how large the drive is ? I can get hold of a 2.1gb Segate drive (ST 32155N) , will this work ok? I'm not that bothered if I can't access all 2gig, just as long as it's substantially greater than my current 80mb!

Hi

Well all major TOS's have already been dumped, many are available for
download at http://homepage.mac.com/carlhafner/AtariTOS.html

They're on the net as ST emulators such as (STeem, Saint and Winston)
require them.

From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3bd0221a2c29292@madasafish.com>
Source record: 41328

Hi

My Falcon clock is so strange. It still has problems and was testing and I checked what the time was on the clock.cpx and it said 13.49 (same as taskbar). A couple of minutes later it was 13.51 and then the next time I looked after reading some mail it was back at 13.49!!

Maybe my chip is wrong? Or would a long keyboard lead do this as I do have my keyboard lead about 2 metres long. I'm not sure what the keyboard controller does for the time on a Falcon when it has it's own clock on the motherboard.

Thanks in advance.

I do not see a problem other than the fact that you may not access the
whole drive. You may want to load in Magic or Mint. That way, you will
get to access the whole drive.

Thats a problem of the internal MegaSTe controller.
Parity must be off on all devices they are connected to this controller.

Other is the termination. Some devices wonï¿½t work if termination ist on,
other work if the termination is off. Suspect part of MegaSTe and
Stacy Controller.

(Bests sign for parity on is if the MegaSTe wonï¿½t accept the drive)

> 2.1gb Segate drive (ST 32155N) , will this work ok? I'm not that bothered
> if I can't access all 2gig, just as long as it's substantially greater

Thatï¿½s is a part of the used TOS and a question how large you defined
the size of any partition. Size of a partition had nothing to do with
the device size.

OS-Release Partition Size

TOS 1.00 - 1.02 256 MByte
TOS 1.04 - 3.0x 512 Mbyte
TOS 4.0x 1024 MByte

MagiC / BigDOS 1024 MByte
2048 MByte (DOS-Kompatibel)
MagiC 6.10 FAT32 -> Terrabyte (not MagiC 6.01) !!

FreeMiNT 1.15 / FAT16 2048 MByte (DOS/TOS komp. Partitionierung)
FreeMiNT / FAT32 -> Terrabyte

You need an hard disk driver they can switch parity off /on over
software. Modern devices doasnï¿½t had an jumper for parity. Also you
should connect the device to an computer they can handle parity.
Falcon, TT as example.

Regards, Robert

Edward,

Was it the Yamaha CDRW that the fan fell apart? If it was I would replace the can from what I have read and heard the Yamaha will have problems with the heat.

You should make a bug report to the author.

>than 1 GB to be used.

And maybe this is why my 7 partitions of nominally below 2Gb (1990Mb) aren't even recognised by Magic 6.01, never mind TOS 7.04 (Centek). Even when I changed the type to BGM (Big GeM) their capacity wasn't recognized by the OSs. Jinnee and HD Driver knows they exist, but other than that its a no-go!

Only way now is to try say 1600Mb partitions with MagiC.

Big drives aren't always faster either, this Seagate UDMA ATA 20Gb unit is actually slower than the Maxtor 2.1Gb I had installed previously data transfer rates drop to less than 3000Kb/s, whereas I was getting 3600 on the old Maxtor! What a disappointment, no chance of recording at x6 speed on the CDRW.

Neil.

You don't suppose the manufacturer of the drive had any REASON to put a fan there, do you?

How's the ventilation in the case the drive is installed into? Does it seem overly warm after it's been in use for a while?

Remember, heat is the #1 enemy of electronics.

If it seems to be cool enough after it's been used, go ahead and live dangerously if you want, but keep in mind that it may shorten the life of the drive.

I heard some while back of a hack to enable 2in1 to talk LFN's, if you use a binary editor to find the signature Magx (not sure of case) and replace it with MiNT, 2in1 will now happily pass LFN's to the archive engines, these have for some while been able to speak the lingo..

```
TT (SCC) LAN port pins, according to the manual, look like this (in a
circular 8-pin female mini-DIN RS-422 socket); Serial 2 is disabled if
LAN is enabled: [monotype, not proportional]

[ ]
[8] [7] [6]
[5] [4] [3]
] [2] [1] [
The Atari A to Z (Mark Baines) adds:
|
1 = Handshake Output | (DTR, RS-423) SYNCO
2 = Handshake Input or Internal Clock | SYNCI
3 = *Transmit Data Output | - Transmit data inverted /TxD
4 = Ground |
5 = *Received Data Input | - Receive data inverted /RxD
6 = Transmitted Data Output | + Transmit data TxD
7 = General Purpose Input | GPINP (TRxCA/CTSA)
8 = Receive Data Input | + Receive Data RxD

Mark Baines, p 127, describes it in words. It is claimed to be Apple
Local-Talk compatible.

Hope this is some help,
Charles.
```

Be certain the floppy disks are formatted as 720K (Double
Sided/Double Density).

The Atari floppy drives won't read a "normal" High Density (1.44Meg)
floppy disk format.

I don't know if the Mac can format an IBM/Atari compatible 720K disk,
so you might be best off formatting them on the ST itself. If that
doesn't work (if the Mac has any trouble reading the Atari format),
try formatting them on an IBM (as 720K).

That should take care of getting the files into the ST- from that
point you may have to do some uncompressing with various utility
programs to re-create the original disks.

When I bought my link II interface for my mega back in 96 or 97 it came with a version of MiNT which would enable a cdrom. I'm running a much later version of MiNT on my mega4 now and really would like to move data via cd or some other way than slip at 19200 baud.

Is there a MiNT way to mount a cdrom?

Thanks

Jeff

The internal host adapter of the STE can only address 1 GB of capacity,
even if you have a larger drive. In order to address more than that
another host adapter is required.

That's not correct. MagiC or MiNT cannot enable the STE's host adapter
to use more than one GB of a drive. The problem is not the partition
size here but the capabilities of the host adapter.

It's not the formatting but the partitioning. Formatting is always
platform-independent.
AHDI uses a linked list of root sectors if more than 4 partitions are
present. The ICD software's default is putting up to 8 partition entries
into the first root sector, which is not what the standard mandates. As
a result most non-ICD drivers do not recognise more than 4 partitions.

The IBM publicly-available POP designs and Bill of Materials for the latest version.

For this stage, I need someone (or a couple people) who are familiar with PCB layout/design.

For the next stage, I need someone (or a couple people) familiar with programming MiNT, FreeMiNT, SpareMiNT, etc.

And, does anyone know if/where a generic Atari ST emulator is in the PowerPC sector? Source code is a necessity and a person (or persons) who can code. The original programmer would be best.

"All it takes is just a few people to start agreeing..."

There are some emulators like Pacifist that use files in a different
form. That may be the same with the emulator above. I was able to take
those files that Pacifist uses and convert them over to a form that my
ST could use. I would think the same could be done in your case. What
is the file extension of the programs that noSTalgia uses?

Hello,

What is the address you downloaded Porthos from? The one that was
previously posted does not work. Is there a webiste devoted to it?

Hello,

Le vendredi 19-10-10 13:48, Lyndon Amsdon ï¿½crivait:

>>Furthermore it's impossible to view a pdf file under N_AES. If I try I
>>get a Runtime error 213 at offset $0008540A.
>
>
>I've heard that from another Mint+NAES user. I got that Runtime error
>first time I tried to load a PDF but next time I loaded Porthos up it went
>away. It runs OK under Magic but I imagine these kind of bugs can be
>sorted out by the next release.

The first time I opened a pdf file I had the same error too. Then I changed the memory flags of Porthos.prg from private to global (without memory protection) and now all is well. Don't ask me why. It seems to be much faster than gemgs. I haven't tried printing yet -- don't know if it's allowed in the demo version, anyway.
Hope this helps.

J-F.

4211. [www] Atari Icon Library updated

Newsgroup: comp.sys.atari.st

From: gokmase <fale@cybercrap.no>
Message-ID: <Usenet.ihpogklo@localhost>
Source record: 41333

Hi all,

Finally I have found time to update the Atari Icon Library,
this time with 11 archives supplied by Matthias Jaap :))

archive 95 - 77 archeology icons
archive 96 - 75 Babylon5 icons
archive 97 - 22 VW Beetle icons
archive 98 - 19+19 game console icons
archive 99 - 50+23 Dark Angel icons
archive 100 - 7 octopus icons
archive 101 - 78 pencil icons
archive 102 - 21+21 penguin icons
archive 103 - 10 seahorse icons
archive 104 - 9 treefrog icons
archive 105 - 91 tree icons
archive 106 - 60 woman icons

Thanks to Matthias for a great contribution :)

Regards,

Joakim

>CompactFlash card works, any CompactFlash card should work.

Yeah - I'm not worried about compatibility of the card itself, more about the format that the camera saves in. This incident shows that the camera that I borrowed the card from doesn't save files in a format that I can read. Then again, it doesn't seem to be saving in any standard format as not even PC programs can read it! The 4 files contained on the card all had the same problem so it wasn't just one corrupted file.

So after I've decided on a camera, the final step is to ensure that I can actually read the files it produces.

>When are you going to get your camera?

Around Christmas hopefully - depends on my credit card balance!

Hi Steve!

Do you mean in the 2-in-1.PRG file? There I only found 'MagX' at
offset $2e86. I changed that to 'MiNT' but the 2-in-1 windows
still showed the abbreviated filenames with '~'. Or do you mean
that it can ZIP/LZH etc LFNs and unzip them again?

I am sure that Uwe will pop up soon, but AIUI you don't need
HDRIVER installed on both disks - the internal one will do. During
the boot process, just press the corresponding to the drive you
want to boot from, and all AUTO, ACCs etc will be loaded from it.
Mind you, I don't know if the Mega STe is different in this
respect, but doubt it.

what a pain indeed! :-(
If you purchased Magic 6.01, then the upgrade to Magic 6.10 is 39$US.
But the upgrade from 6.10 to 6.20 is free?!
Let me guess that there were some bugs in 6.10 that desperately needed fixing,
so the 6.20 upgrade is more like a patch to 6.10?
ken

4231. gnu lcomm and bss variables

Newsgroup: comp.sys.atari.st
Date: 2001-10-22 13:47:29 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3BD42371.AF1F1A3F@siemens.at>
Source record: 41203
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

For one of the projects I am working on I needed a program that converts code from gnu assembler to devpac assembler syntax. I wrote a program and checked the differences on the resulting .o files using TTdigger (great program, Henk, many thanks for it). ATM the situation is that nearly all produced code is equal. The main difference is, that gnu .comm variables which I translated to xdef variables in the bss section should be translated in some other way, because in one .o file they are included as 0 and in the other .o file it's 6xxx. This wouldn't be a problem if the resulting program would work but it doesn't. BTW, after assembler I called gst2gcc to convert the .o module and then linked it with other gnu objects.

Many thanks for any idea
Gerhard

>restriction but as it work under MagicMac this must be a bug.
>Furthermore it's impossible to view a pdf file under N_AES. If I try I
>get a Runtime error 213 at offset $0008540A.

It's *not* a program related bug, but an OS-related bug. If it would be a
program related bug then the same would happen under MagiC. Invers like
most commercial developers doesn't explicitly guarantee or even mention
that the program will run under freeMiNT/N.AES....

>Another strange thing is that when I use Freedom 2.05 as fileselector
>Porthos keeps saying wdialog isn' started. Wdialog is in memory as I can
>use for instance arcview and Phototip.

You know very well that this isn't strange at all... in fact it's common
practice. According to the freeMiNT 1.15.12 docs Wdialog and Freedom are
"dirty" programs and it's recommended not to run these...
Invers should be applauded for releasing this long awaited app instead of
getting an earfull, Porthos being able to run under freeMiNT/N.AES is not
relevant at all since it works perfectly under the OS it's ment to run on.

Cheers from Belgium
Dennis

Hi Ken,

>I have the same problem Frank!
>I downloaded the 'update' and it plain does not work.
>I hope someone has found a way to get it to work.

The patch can only update MagiC 6.10, note that version 6.01 is not
the same as 6.10....
Also note that the MagiC 6.20 translation on the DDP website should
only be used with a succesfull updated MagiC 6.10, some files in the
archive are different to the ones used in the MagiC 6.10 archive.

Cheers from Belgium
Dennis

Hi Martin,

>And yet, it's true. The European law is not effective yet but the
>Belgian government didn't wait until the Eurpean law will become
>operative.

Yes, (unfortunately) it's true... my ISP is enforcing that new law also.

>Directtly after I've posted my first message I noticed Newswatch
>supports User Authentification. Alas it seems not to work at all. The
>newsserver refuse to send out messages (authentifications failed)

IConnect supports user ID and password authentication for USENET so
it's not really a problem for me. Are you sure the problem is related
to Newswatch? I wouldn't be surprised if your ISP is goofing somewhere
along the line. In my experience most of the problems we occasionaly
face are nearly always ISP-related, these meatballs assume we all work
with Windows or similar crap.... they usally don't have a clue.

Cheers from Belgium
Dennis

Hi Neil,

>Only way now is to try say 1600Mb partitions with MagiC.

Or upgrade MagiC to 6.10 or 6.20...
From version 6.10 onwards FAT32 partitions are allowed meaning that
it's possible to use partitions with an nearly unlimited size. You
could even partition the 20G drive in just one single partition...

>data transfer rates drop to less than 3000Kb/s, whereas I was getting
>3600 on the old Maxtor! What a disappointment, no chance of recording
>at x6 speed on the CDRW.

The speed of a hard disk is only one factor which affects the speed at
which one can burn CD's. The processor plays quite a big role here as
well, you can't expect miracles from a 68030... a Atari clone with 68060
for example can easily manage 8X speed, while the hard disk only manages
an average data tranfer speed of 3200kb/s.

Cheers from Belgium

NVDI 5 has lots of new functionality to deal with palettes and bitmaps.

I haven't been able to test Porthos (?) myself yet, since I only have
MiNT/N.AES on my computers now, and WDialog does very bad things to the
stability of my systems. With N.Dialog installed, Porthos complains about
the lack of WDialog.

With today's SMD resistors and capacitors and other miniaturized components, having an actual ST 1040ST in vastly less space should be entirely possible. Couple this "mini ST" into the gut of a Neotari computer and... hmm.

Did you check the rubber belt that connects the motor spindle to the
diskette spindle. Replacing that might solve your problems. I think
it's the weak link in many drives. Everything else lasts for many years,
but the rubber belts stretch or loose their rubberyness in a much shorter
time.

There we go again. All what I've to say is that the author is doing his
best to get it running under N_AES. Today I received a beta from the
author and yes it does work now more of the less. There are still a few
problems left but these will be solved very soon.

I know you hoped Porthos would be a MagiC only program *BUT* alas it's
not.

>Invers should be applauded for releasing this long awaited app instead of
>getting an earfull, Porthos being able to run under freeMiNT/N.AES is not

I have tried it *with* Wdialog installed (MiNT, N.AES and WDialog) only
to find that it still displays "WDialog not installed" message. Other
programs, such as Papyrus or Artworx, recognised Wdialog properly
and used it to display eg. printer dialog.

I have also tried it with MagiC 5.2, MagiC 6.1 and MagiC 6.2 - but
it crashed (2 bombs) when opening PDF file. So I gave up :-(

Probably will not do any harm to have it on both, but only Uwe can
tell for sure. Of course, you can always have HDDRIVER on A:, provided
both machines have a floppy drive, and boot from that when the
external drive is used with the STe or MagiCMac.

>> During the boot process, just press the corresponding to the drive you

Sorry, missed out a couple of words. Should have been: 'press the
letter coresponding to the drive partition you want to boot from'. The
hard disk driver itself only will then be read from C:, after which
you skip to the selected partition. That way you can have several
different ACC and AUTO setups without using a boot manager, though of
course they will each take up disk space.

I have, but it seems less convenient than 2-in-1, which at least
shows the contents of an arcvhive when you click on it. ArcView
only brings up file selectors and then uses a sseparate window to
show you what's in the archive. But this is a minor drawback
compared to having LFNs.

>utility.
>
>>No, that`s not right so. You can choose the language in the program:
>>menue "Einstellungen -> Sprache". You choose your language and then you
>>must restart the program.

The one I downloaded came up with English menus straight away. BUT
I think it may be corrupted as it crashes immediately it is
double-clicked. If I drag a PDF file to it, the Porthos window
opens and the first page of the document is displayed briefly and
then it crashes again with an 68000 exception Error #-69. I have
been in touch with the author, who is surprised at this. Hope to
try another copy from a CCC colleague soon who didn't have this
problem.

One interesting sideline: As the Porthos manual is in PDF and I
couldn't get Porthos to work, I printed it out with GEMGS. The
strange thing is that V1.3 only showed and printed the first 10
pages; this is something I noticed before with multi-page PDF
documents and this version - it seems to stop less than half-way
through a PDF doc. On the other hand V1.2 printed all pages out
fine, though I could not get 'Go to Page' or 'Next page' to work
and had to print the lot again (these commands worked in 1.3 - but
what's the use of a partial printout)?

>Has anyone bought this program yet, how does it cope with PDFs that GS refuses
>to read?

Don't know, but the manual says that at present the evaluation of
linearized PDF documents (whatever *they* are) is not implemented,
neither are outlines and thumbnails, Acrobat forms (interactive
dialogs) are not yet, and they point out that there are documents
that consist exclusively of these forms and that these cannot be
displayed. Special opening actions are not yet implemented, nor
Text Notes to PDF pages, hypertext links, Text marker and movies
and sounds.

While a lot of HD drives seem to to be contributing, I thought It a
good time to air my query.

I have an external SCSI drive attached to my STFM. It is a Quantum
Maverick 270mb. I am thinking of repacing it with a Gbyte drive which
I can use mainly with my PC.

Can anyone recommend a a compatible replacement.
I see Fujitsu 9Gb for about £90. Good?

Thanks
Norm

The one thing to keep an eye out for is the atari specific components, they'd
still be the same size as always unless you located a compatable replacement.

Never had any problems on my Falcon and my Epson 760, neither with
5.02 nor with 5.03 although at 720dpi and best quality printing
5.03 is notably slower.

> newsserver refuse to send out messages (authentifications failed)

Well, I can just tell you that I use the authentification with Newswatch
when I need to connect to my regular news server when I'm not connect to
its hosting ISP.

You need a file named authinfo.dat in the same folder than Newswatch.
Two lines in this file: 1st line for the login and 2nd line for the
password. In my case, login/password are the same as those used for the
pop3 server.

Bye,
/Pascal/

Welcome back, your newsfeed working again, did they sneak in authentication
without telling you?

>IConnect supports user ID and password authentication for USENET so

I too had to use authentication with 08002go's news server, until they closed
down!

>it's not really a problem for me. Are you sure the problem is related
>to Newswatch? I wouldn't be surprised if your ISP is goofing somewhere

I can't imagine that Newswatch and IConnect deal with this in different ways -
Newswatch's docs say that it's possible so it should work.

It isn't without its problems however - I had "Fatal system error" several
times whilst trying to load docs other than its manual.

There are some nice points in it aside fdrom its speed, for example exporting
images, vector graphics and text - the latter doesn't do anything, but is
presumably an unregistered user restriction. The popup can be called with
[Alt]-left click inside the document window.

That's so, but I find it so much more convenient to drag files from an
Arcview window to where I want them there-and-then, rather than later from
the 2in1 directory or whatever.

>Another thing was that it didn't decompress properly. Several files
>inside folders were missing.

You should report this if it is a bug.

>Why do you and others suggest using ARCview instead?

Because it fits in much better with modern operating systems and desktops
than that old thing, you can view ANY file for which you've got a viewer set
up, you can actually RUN programs from inside the archive contents (you must
have previously viewed any associated resource files etc). Need I go on? ;-)

You should install Arcview as the app to open archive filetypes. If you just run Arcview from the desktop then you'll have to go through the malarky of searching for the archive to open with the file selector.

I think that you will have problems, for as far as I know it isn't possible
to share drives that have more than one partition between these two platforms.
Unless you mean to actually share the SCSI bus between the two systems of
course, or don't mind that restriction!

Printing only works properly under MagiC (atleast on my TT), but I have
never been able to print a full page without a crash on my Falcon.
Printing to a file only works with MagiC, not TOS or MiNT.

I agree, I had to buy my GT Scanner second hand which I've never that keen
on. But hardware vendors (makers?) just don't give out all the technical
information needed to write a driver. I guess most of it is educated
guesses.

Hi Dan!

>Is the TOS upgrade really worth it? What advantages does the TOS upgrade
>give?

TOS 2.06 is great. The machine feels faster and it's very stable, it also
allows auto booting off the IDE drive so you don't need a floppy disk in
the drive, whereas SCSI will autoboot even if you have TOS 1.02 (or 1.00
even?). I would go for IDE but if you want lots of drives and external
stuff go for SCSI. Both are about the same speed.

For some of them yes but it may not save space that way. Other possibilities are for small quantities is to order the originals from best electronics, or a better plan would be to find a close equivalent and use some pal/gal logic (if needed) to keep the new replacements compatible with the original. Also since some new ports would be in order, say like usb or firewire, some modifications to Tos would be good idea to keep stuff working ok.

I fully agree.. I guess we shouldnt point to bugs. Some ppl just dont
understant that poining bug's out just helps the authors to get
application better! I didnt see a single bad meaning messages, just some
reports that Porthos dont recognize Wdialog. But thats just too much for
some ppl...

> *It does not run perfectly under MagiC*

Amen.

Janez

P.S. I also mailed author (extracted main from RSC) and he didnt see that
as offensive act! In docs he said it should work on MiNT/Naes, he prolly
cant test it and bug reports ARE WELCOME!

4280. Stupid hard drive *mumble*

Newsgroup: comp.sys.atari.st
Date: 2001-10-23 21:24:31 UTC
From: Iggy Drougge <optimus@canit.se>
Message-ID: <9r4n6f$2j7$1@dos.canit.se>
Source record: 41239

I recently tried to install RISCPLAYER as an accessory on my SH205, but
forget to put its configuration file along with the program itself in the
root of the drive. Now, every time I boot my STE with the SH205 plugged
in, a requester will just pop up, telling me that the config file has gone
missing, and when the requester is dismissed, the machine will reboot,
repeating the same procedure over and over again.
What am I to do? The HD seem to take priority over the disk drive.

My DeskJet 520 (and NEC P2200 24-pin for when I need carbon
copies) work fine with NVDI 5. BUT it is much more picky about
fonts: Even with font checking switched off, there is a large
number of TTFs that NVDI 4.11 printed OK but NVDI 5 rejects.

Hi All

Chris Sansom, author of Fractal Music ST has now completed the Docs in PDF format. They are now available on the UPDATED FMST page on my site.He has done an excellent job with plenty of illustrations within the text.

http://tamw.atari-users.net/fractmus.htm

You can also download the program there (of course! :-)

Chris also provided an Email address for feedback regarding his program:

fmst@highway57.co.uk

Have fun with Fractal Music ST !

Try holding down the ALT, CTRL and/or SHIFT keys when booting. Most
(all?) HD driver software will not run when a certain key/key
combination is pressed, letting you get to the desktop.

Regards,
David Bolt

> I have the option to swap my old TT with a PowerMac 9500 MT 180, can I expect
> to use it with MagiCMac faster then now keeping compatibility ?

No.... compatibility and speed are better on 68k Mac (Unless you use a G3 for speed!)

I use MagiC Mac for years and I tried several Mac models... on old Centris 610 it was nice (68040 @25 MHz) it was afster than my TT. The best was on Powerbook 540C - notebook with 68040 @ 66/33 MHz! MagiCMac runs great and faster than Medusa or Hades. This is the best solution for portable Atari emulator.

I have MagicMac now on my PowerMac 4400 upgraded to G3 @ 240 MHz and it is extremely fast but it was much slower before upgrade (power PC 603 @ 200 MHz) than my ex Powerbook 540C with 68k!!

It also runs on my Powerbook 1400 (PPC 603 @133 MHz) but it is not too fast.

If you are interested I can post some benchmarks here...

MagiCMac is absolutely the fastest OS on my G3! It si much, much faster than Mac OS :))))))

Bolid

> reconfigure?

It might work without re-configuring if you change the device order as
described in the HDDRIVER manual. If the device that is usually *not*
connected is the first device, it will have partition C,D,E,F, but only
if it is present. Otherwise these partitions will be on the other drive.

There is only one type of program that requires the AHDI compatible
partitioning scheme: Any fully AHDI-compliant hard disk driver. For
other programs this is not relevant as they usually do not access the
partition table.

That's not true. I got the Runtime error message with MagiC 6.10.

As other people, I also have a 68000 error (2 bombs ?) with a lot of
files. I tried with Tos to "see" the bombs but the program complainted
about WDialog not installed (but it IS installed, v2.04 iirc).

On some files, the display is not quite correct (compared to GemGS or
Acrobat reader) but it's not too bad for a beginning imho. Speed is far
better than with GemGS. Not time to buy it though, imho again, as far as
so much files crash the program.

Bye,
/Pascal/

Hey everyone!

I was thinking about actually purchasing Papyrus for my TT 'cause I'm sick of AtariWorks. Does anyone know if ROM or anyone else had converted the enormous Papyrus help files to any sort of useful format? Loading the help file on my TT takes ages in the demo. I'd really like to purchase a nice word processor, but I'd like the help files to be laid out a little better.

BTW - Are there any other programs I should be looking at? I need a word processor entirely in English since I don't speak or read German.

Thanks!

Most cameras don't save in standard format, that's why they are supplied
with drivers and custom software.

>So after I've decided on a camera, the final step is to ensure that I
>can actually read the files it produces.

This is the normal procedure. But an Atari user has to follow a different
approach. First of all you should download PhotoTip and take a look at the
list of supported cameras. If the one you decided on is on the list then
you shouldn't encounter any problems. If it's not supported by PhotoTip
then you're in trouble... PhotoTip can do a whole lot more then just read
the files in the camera, download the demo and be pleasantly surprised...
PhotoTip homepage: http://home.sunrise.ch/dursoft/

The next, soon to be released version of PhotoTip will come with English
docs and manual.

Cheers from Belgium

Hello,

Le mercredi 24-10-10 19:01, Jeff Armstrong ï¿½crivait:

>I was thinking about actually purchasing Papyrus for my TT 'cause I'm
>sick of AtariWorks. Does anyone know if ROM or anyone else had
>converted the enormous Papyrus help files to any sort of useful
>format? Loading the help file on my TT takes ages in the demo. I'd
>really like to purchase a nice word processor, but I'd like the help
>files to be laid out a little better.

Load the help file "pap_help.pap" as you would with any other ".pap"
file (it's a standard Papyrus document), save it, close it then press the
HELP key. The help file will now load /much/ faster.

From: taj16@dreamscape.com
Message-ID: <ttf4859umeda54@corp.supernews.com>
Source record: 41170

I just got a couple of great deals on some 200Mb Syquest drives and carts. I"ve had one for years on my Mega STe and now expect to put at least one on my PC. I have two questions:

Is there any way I can get either Windows 98 to read/write to an Atari Syquest cart, or alternatively, get an Atari to read/write a Windows 98 cart? I can think of some times when I might want to transfer some files(graphics mostly, I think-for PageStream) from the PC to the Mega STe, and while I can use floppies the Syquest would be much quicker. I currently use ICD software on my Mega STe.

If I were to get an emulator for the PC, could I use the ST Syquest carts I now have set up, or would I have to make new ones? I'd need to be able to "boot" the emulator system from the ST carts for them to work properly, and I'd need for the emulator to see the partitions on the carts as the Atari C:, D:, etc drives.

Have you had any contact with ROM recently ? I sent Ulli some bug reports for the Windows version of Papyrus ages ago and never heard from him. (I can't get it to see new fonts.) Do let us know if he is still around.

Regarding the help file - if I load it into Papyrus as a PAP document it takes maybe 10secs on the Hades, but if I go to the "help" menu then I can access it instantly. I don't know if this feature is there in the demo.

Otherwise I think it's an excellent programme, I always use it on the PC. I seem to remember there were some restrictions when using it to view "word" documents, but I've managed to convert several which have been sent to me.

Cheers

Paul

Yes, this is possible with cartridges that were partitioned with a
single partition that is both PC and Atari compatible. HDDRIVER supports
this and except for HDDRIVER no additional software is required for the
Atari or PC. See http.//www.seimet.de/atari_english.html for more
information.

>drive being external, would be plugged and unplugged as required.

Unless you run MagiC on your ST you will fall over the maximum partition size
of 512MB. You'll also run into the problem I mentioned above - you can only
share drives which have 1 partition between the two systems.

Practically, you would need to run MagiC and to have formatted the GB drive as
one single partition, mixed TOS/Windows compatible with HDDriver. You would
have to boot the ST from another disk as the maximum size of a boot partition
is 32MB. I'm sure someone will be along to correct me, but this is how I see
it.

HTH.

Hi Janez,

>I fully agree.. I guess we shouldnt point to bugs. Some ppl just dont
>understant that poining bug's out just helps the authors to get
>application better!

-Some pll don't understand that pointing out bugs in a newsgroup is not
constructive at all. Bugs should be reported to Invers or the author.
-Some ppl don't understand the difference between a program related bug and
an OS system extension related bug either...

>I didnt see a single bad meaning messages, just some reports that Porthos
>dont recognize Wdialog. But thats just too much for some ppl...

What you read were reports that Porthos doesn't recognise WDialog *under*
MiNT/N.AES... that's not exactly the same is it? The docs don't claim that
Porthos will run under MiNT/N.AES, so what's all the fuss about? It doesn't
run under TOS either, have you seen any remarks here about this?
All I've seen in this thread was negative feedback. The way some ppl are
carrying on here, one would think that Porthos is the biggest crap ever
released...

It might come as a surprise but the demo actually works, one can view the
first page of a PDF file and print it out, printing to an IMG file also
works. In fact the demo does exactly what is promised, nothing more and
nothing less.
But that's a dumb remark ofcourse, some even call it trolling, one shouldn't
write here that an app which has problems under MiNT/N.AES works under MagiC.
One should put a sock in it and shut up ...:-/

>P.S. I also mailed author (extracted main from RSC) and he didnt see that
>as offensive act! In docs he said it should work on MiNT/Naes, he prolly
>cant test it and bug reports ARE WELCOME!

Good, that's the correct approach!! moaning about it in CSAST doesn't solve
the problem.
But we're not talking about just another beta version here are we? I find it
hard to believe that Invers hasn't tested this app inside out, the demo only
has restrictions as long as it isn't registered. It will not run any better
under MiNT/N.AES by simply entering the serial number. The current version
doesn't work under MiNT, a future version might, but that's not a reason to
bash the program, Porthos is a very nice app, future versions can only get
better. A lot of people have been waiting for an utility like this. It is
finally here now and it *works*, why it doesn't work at the present time

under MiNT/N.AES isn't relevant at all.
If the demo doesn't work with your setup then don't register it, if enough MiNT/N.AES users complain to Invers then they will make it compatible, it's simply a matter of economics...

Cheers from Belgium
Dennis

>There we go again. All what I've to say is that the author is doing his
>best to get it running under N_AES.

No, that's what you're saying now, previously all you've had to say about Porthos was negative. Instead of being pleased that we finally have a PDF reader you start moaning about trivial things...
You're the one telling us all the time to read the freaking manual, if you would have followed your own advice for a change then this silly thread didn't need to develop into another holy war against non-MiNT compatible apps. There isn't a single line of text in the manual which claims that Porthos actually works under MiNT/N.AES, yet you keep on moaning about it.

>Today I received a beta from the author and yes it does work now more of
>the less. There are still a few problems left but these will be solved
>very soon.

More or less?
Porthos is a very simple app. You can either load a PDF file, view it and print it, or you can't. If you can it works, if you can't it doesn't...
Make up your mind please. BTW this thread is about Porthos 1.21 which is for sale right now and not about a beta "with a few problems left that need to be sorted out". One doesn't need a crystal ball to realise that these "problems" are printer-related. Unless the author writes a custom printer routine there's no way Porthos will ever output one single letter to a sheet of paper under MiNT/N.AES with Wdialog. If he can pull this off then he deserves a Nobel prize. People who buy version 1.21 will expect at least the same functionality from a future version, they will not be very happy with a program that has some of its features clipped to please some MiNT users. If this is what is going to happen, expect some fireworks in here... It's about time I think that someone tells the author that his app works just fine and that he should put all his efforts towards making Porthos more compatible with some of the obscure PDF formats instead of waisting time pleasing some people who simply can't be pleased.

>I know you hoped Porthos would be a MagiC only program *BUT* alas it's
>not.

I told you that the current release was going to be MagiC-only, and you didn't believe it, correct me if I'm wrong but from what I've been reading here so far it seems to me that this statement was true. I don't care if an app is MagiC-only or not, all I care about is that I can run it.

>*It does not run perfectly under MagiC*

Like it or not, but it *does run perfect under MagiC*. I can view the file, print the file to paper or as IMG, crop the size of the document, get info about the file etc... in my book that's working correctly. Except for the functions that are disabled in the demo, everything works.

>Get lossed. I'm really sick and tired of your anti-MiNT comments.

As long as you and some ppl here can't accept the fact that some apps which use the advanced features of NVDI 5.0 and Wdialog will not run the way they should under MiNT, I'll keep reacting to silly threads like these.
You did an excellent job as far as putting potential buyers off goes, if my memory serves me well you did pretty much the same thing when PhotoTip was first released... I'm getting sick of this crusade against apps that don't perform well under MiNT/N.AES.
You know that certain functions of Wdialog don't work under N.AES, isn't that the reason NDialog is written? You also know that Freedom has problems with MiNT, and yet you take this as another brilliant example to convince us how poorly Porthos works? What's next?
Sorry, but to this kind of crap I'll keep commenting, this has nothing do to with being anti- or pro-MiNT, it's all about being fair. Invers doesn't deserve this kind of bashing, especially since Porthos does exactly what is promised in the manual.

>Do you really haven't other things to do.

YES !! reading and printing some PDF files with Porthos for example :-)

>Don't bother to reply to this message. I won't read your dumb comments
>anymore.

Hallelujah...

Cheers from Belgium

>to find that it still displays "WDialog not installed" message. Other
>programs, such as Papyrus or Artworx, recognised Wdialog properly
>and used it to display eg. printer dialog.

Porthos uses a function of Wdialog that AFAIK hasn't been implemented in
other programs before, an extra menu entry is added to the NVDI printer
dialog, if that dialog isn't present one can't print the PDF file. Why that
function isn't recognised properly under N.AES is something I'm not going
to comment on.... :-/

>I have also tried it with MagiC 5.2, MagiC 6.1 and MagiC 6.2 - but
>it crashed (2 bombs) when opening PDF file. So I gave up :-(

Do make sure that the checkbox "Mac fonts" is activated in the Fonts&Caches
CPX from NVDI and set the cache to minimum 1Mb . Check if you have enough
free memory, Porthos consumes a lot of memory, to display a 250Kb PDF file
containing 20 pages of text with no graphics nearly 7Mb is used....
Also check if your HOME folder is set up correctly, the Portos.inf file
should be in the HOME/DEFAULT folder not the HOME folder.

Cheers from Belgium

For a drive connect to the ACSI drive the device numbers are most likely
0-7, for devices connected to SCSI it's 8-15.
01.00 as reported by HDDRUTIL refers to the SCSI driver's device
definition and denotes the first device (ID 0) on bus 1 (SCSI). This is
most likely device 8.

Hi All

Just updated my DAVID SNOW page with the addition of putting in Edgar Aichinger's version of MidiSquare, which turns the original midi square into
an ACC as well as improved looks and dialog. Its great you can improve upon
something that is already good! Edgar is part of the Atari-Midi Mailing list, and has also created an excellent Fractal Music generator, although still in Beta stage. It is available in the same link provided for his version of MidiSquare.

So check it out:

http://tamw.atari-users.net/snow.htm

Thomas,

I've had some experience doing this. I can't say for sure if it can be done on the PC. But I've done it on my Mac using MagicMac.

It's easy to do on the Mac since the SCSI bus in built in to the system. I connect the Syquest drive (or a ST hard drive) and run MagicMac. I will get a icon to the hard drive on the Magic desktop. I then just copy the files to the Mac hard drive then burn them onto CD.

Since the developers have come out with MagicPC, this might be a possibility.

I have tried using TOSBox on the PC and see if I could get it to see the drive. Had no luck. The trick is to somehow get the drive mounted and seen by the Windows OS. If this can be done, then you should be able to read the AHDI partition using TOSBox.

Best of luck on this.

> format? Loading the help file on my TT takes ages in the demo

I don't know if you tried that, but if the papyrus help file takes *too*
long to open when pressing Help key, you should do the following:
Open the help file as a normal papyrus document (File -> Open document),
wait till it's loaded and shown on screen, and then *save* it again,
under the same name, replacing the old help file. I think it is mentioned
in the manual. The point is that papyrus sometimes need not only to
load the help file, but also to *reformat* it (when it is in its original
form), and that indeed takes ages. When you save it on your system,
papyrus would only need to load it, without reformatting, and it should
take 10-15 seconds on a TT with TT-RAM.

I am proud to announce the launch of the Official Cleveland Free-Net Atari SIG Archive.

http://www.atariarchives.org/cfn/

The Cleveland Free-Net, a free dialup and telnet BBS offered through Case Western Reserve University, was home to an active group of Atari users. The Atari SIG (special interest group) had information about every Atari platform, including 8-bit computers, 16/32-bit computers, Jaguar, Lynx, and Portfolio. The Cleveland Free-Net was shut down on September 30, 1999, but before it was, a complete backup of the Atari SIG was made.

Working with the folks who ran the forum, we have endeavored to preserve both the feel of the SIG and the information it contained. This is an amazing resource that exceeds 200 megabytes of data - much of which isn't available elsewhere.

"The Atari SIGOps hoped to preserve this extensive information resource we had built over the years. We approached www.atariarchives.org and Kevin Savetz with the idea of a permanent web archive of our SIG, and we couldn't be happier with the result." --Michael Current, mcurrent@carleton.edu, former 8-bit Atari SIGOp, Cleveland Free-Net Atari SIG.

Among the highlights:

A Time Capsule of Atari news items from 1986 - 1999
http://www.atariarchives.org/cfn/12/03/

Atari 8-Bit Technical Reference Manual and upgrade guides
http://www.atariarchives.org/cfn/12/02/

664 ST-related newsletters, including Z*NET and ST Report
http://www.atariarchives.org/cfn/06/08/

A complete archive of Z*Magazine
http://www.atariarchives.org/cfn/12/05/02/

Reviews of 79 Lynx games
http://www.atariarchives.org/cfn/08/07/

Hi,

It could get quite small.
0402 resistors/capacitors, resistornets, a couple of larger PLD:s for memorymapping etc, a standard MFP, a couple of ACIA:s, a simple IDE interface, floppycontroller.
The largest problem would probably be ST/STE compatible video.

/Peter

Why does people report bugs under MagiC then? Come on Dennis, if you
actually believe that *any* program runs perfectly you probably also
believe in Santa Claus.

> As long as you and some ppl here can't accept the fact that some apps which
> use the advanced features of NVDI 5.0 and Wdialog will not run the way they
> should under MiNT, I'll keep reacting to silly threads like these.

You know better than this... If Porthos use NVDI5/Wdialog features and
these work as intended under MagiC but not under MiNT, then the fault is
neither MiNT's nor Porthos, but NVDI or WDialog. However, it's perfectly
possible that Porthos does have bugs (yes, bugs, not features) that only
appears under MiNT and not MagiC. And guess what, it's not the OS' fault,
but the app's. I know, I'm personally responsible for hundreds of bugs
that acts like this. AFAIK you're not a programmer...

> You know that certain functions of Wdialog don't work under N.AES, isn't
> that the reason NDialog is written? You also know that Freedom has problems

N.Dialog is written because WDialog is mainly written for MagiC, not MiNT.
One of the unfortunate side-effects of this is that WDialog prevents
memory protection from working under MiNT.

Freedom is a very nice fileselector, but badly implemented I'm afraid.
It's responsible for many crashes under MagiC as well. Under MiNT it has
the same problem as WDialog - memory protection won't work with Freedom
installed. And this is a serious problem.

Why does this make a difference? According to the docs, Porthos use
FreeType to render the fonts.

Well even author fixed the app so its ok now, untill now i didnt found
app that did not found Wdialog after i loaded it.. So as i said to author
its small bug in detecting routines (prolly). The fact author add those
routines shows he want that application runs on all OS-es and i can only
gree that! I dont think pointing out in groups is so bad.. There was
report that Wdialog is recognized IF Freedom is not loaded. And i could
get more of testing that way.. We (i can sure speak for myself) were
discussing, not moaning..

> What you read were reports that Porthos doesn't recognise WDialog *under*

> run under TOS either, have you seen any remarks here about this?

Fuss is only about that, that this version has troubles.. I didnt see
any bashing! As i sad, Porthos is only app i know that had troubles with
Wdialog. I dont see any probs reporting that and also mailing the author.
I also offered him testing if he cant try it on NAES

> All I've seen in this thread was negative feedback. The way some ppl are
> carrying on here, one would think that Porthos is the biggest crap ever

Im suprised where u get those views.. Personaly im happy such app came
out, i also have no troubles with Wdialog if needed.. But i didnt see
anyone say it is crap.

>

Well u see, u took it personaly.. U did NOT say that it works on Magic
and have probs on NAES, u bashed MiNT.. Thats diferent. I realy dont care

if u dont use or even like MiNT, but be a bit more tolerant.. I did not see ANY messages about Magic or Porthos being, crap, just messages that there are probs on NAES, one quazi solution which may point out the prob (Freedom related message). I may missed some more offensive messages, since i didnt read list carefully..

> Good, that's the correct approach!! moaning about it in CSAST doesn't solve

> better. A lot of people have been waiting for an utility like this. It is
> finally here now and it *works*, why it doesn't work at the present time
> under MiNT/N.AES isn't relevant at all.

But it is relevant.. I mean, information that without Freedom, problem didt happen or was diferent is VERY important to coder. Same as u said above, so we shouldnt say "um i have troubles on mint/naes, any ideas" and better shutup?

> If the demo doesn't work with your setup then don't register it, if enough
> MiNT/N.AES users complain to Invers then they will make it compatible, it's
> simply a matter of economics...

Well its not that easy. Why i shouldnt ask or help authors to make it better? Better for me and authors. Especialy in this case, cause PDF reader is good move. I also want to help catching other bugs, again to make it better.. Maybe there is a bit of problem of MiNT "mentality", but we also discuss bugs of other apps a lot, no matter is Magic or Mint or Unix related.. discuss it, maybe got advices and ALSO mail the authors. I dont see prob there!

>What am I to do? The HD seem to take priority over the disk drive.

Which hard disk driver are you using? With HDDRIVER you can boot
off a floppy with HDDRIVER.PRG on it by pressing the 'A' key
during the boot process. If you don't have this on a disk, hold
down 'D' and the SH205 will boot from there witrhout trying to
load the accessories. Then go to C:\ and either add the CFG file,
or delete RISCPLAYER and start again.

If you are using another driver, download the demo version of
HDDRIVER and try that (of course you will need access to a machine
that connects to the web!). His pages are at:

Source record: 41195

From MagiC Online:

After our previous news report regarding the $32 dollar PDF viewer, Porthos, the programmer of the project, Wolfgang Domroese, had some things to say in defense of the said short-comings:

1. We stated that Porthos has severe troubles when trying to display recent PDF files.

Wolfgang's defence: The fact is, until now I got only one file that does not work, due to a not-supported color-space. As the manual announces, every user (even a non-registered) can offer me a not-working PDF - and I will try to fix the problem soon.
Please note: there has already been one update to version 1.24 with a lot of bug-fixes.

Version 1.25 will follow soon (not more than one week). It will make old PDFs (PDF Version 1.1) available.

2. We stated that Porthos has problems under N.AES.

Wolfgang's defence: Thatï¿½s true. But even though it was written for MagiC, PORTHOS 1.25 will be able to work under N.AES.

I reported recently that Porthos crashed on my machine with a #-69
exception as soon as I double-clicked it. I found that the cause
was Holger Weets' DOCK.APP in MagiC's START folder - when I
disabled that it seemed to work fine. Since I seldom use DOCK,
it's not much of a loss. Its only advantage over APPLINE is that
it not only allows you to top any application easily, but even any
window of a running application.

Heh, the video isn't that complex on the ST when compared to modern PC graphics cards. It doesn't use a DAC and doesn't do any special hardware anti aliasing and stuff that modern cards are expected to do. I think that could be shoved into a CPLD along with the rest. It may be nice to operate this with some local memory to get higher bandwidth, but the basics would need to be done first, and for a portable ST I'd say lo rez for games. If I ever have the oppurtunity to use CPLDs at my leisure it would be some good fun to try it :)

Firewire??! I don't see the point, writing drivers for it would be a
nightmare. Look at the PCI situation on graphics cards.

Doesn't anyone stop to read what Dennis has to say anymore or do you just dismiss him as an asshole automatically. I didn't read any OS bias in his reply.

Read his input first, then dismiss him if appropriate..

I'm going to have to disagree with you there matey, if peop's post there problems in here and someone has an answer thats not program bug related then thats one less false report to waste the programmers time abd cloud the issue.

> -Some ppl don't understand the difference between a program related bug
and
> an OS system extension related bug either...

That would be highlighted by posting experiences in a public forum.

I saw it being demo'd at the Cheshunt Computer Club, a friendly club in
Cheshunt Herts., a venue where people exchange ideas, problems and
solutions. You also get a free hot drink to liven you up for the return
journey. You should pop along one night, its quiet close to you.

Under a recent MagiC it's called pdlg.slb or so and not wdialog.app.

I think it's also helful to save the font cache, that will save time rendering
the characters the next time (as they will already have been rendered).

Hi Uwe,
I tried numbers 0 through 17 but it still returns to the desktop!
ICD's IDCHECK program shows it as ID 9, LUN 0. I know it is a Seagate
SCSI hard drive so I'm assuming it is connected to SCSI (unless it still
functions connected to ACSI or I don't understand the lingo!). Could my
copy of the program be defective?

4352. [ES] Press release about software patents

Newsgroup: comp.sys.atari.st
Date: 2001-10-26 12:49:10 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <3bd96baacfb240@free.fr>
Source record: 41112

Hi all,

A Press Release about the "war" against softwre patents was sent
recently to the following media:

Le Monde
Le Monde Interactif
Libï¿½ration
Le Figaro
Les Echos
Transfert
Internet Actu
The Register
as well as to smaller media

You can read it at the following URL:
french version : http://www.europe-shareware.org/pages/pr_swpat.html

english version: http://www.europe-shareware.org/pages/pr_swpat_e.html
(translation done by Octavia, only a few sentences modified)

EuroLinux will publish a PR in the middle of this week which will support
ours but with also the "libre software" and commercial software players.

Best regards,
P. Ricard (ES)

I registered the program and it runs great overall. I do get the
"runtime error 204" when loading in some docs with lots of color
graphics. Some of those files load in fine under Magic, but not under
Mint. I noticed also that the pdf Porthos manual file loads in with
color under Mint, but not under Magic. It may be a setup problem at my
end or maybe the program needs a little upgrade. Still, I am pleased
with the program.

>The largest problem would probably be ST/STE compatible video.

The biggest problem is probably that many parts are now out of production -
the sound chip definitely, the FDC also. I am not sure about the ACIA (you
could implement them in a CPLD, too), and even the MPF is getting more
difficult to get nowadays.

Everything that is done by Glue, MMU and Shifter (including video) can
easily be done using some modern CPLD/FPGA.

If you really start to make something like this in a way that can be
produced in more-than-one quantities, you will end up with something like
the Milan II design.

I've downloaded PhotoTip, I can have a play round with it over the weekend.
I've seen the list of supported cameras, however it seems to have been last
updated in June 2000 and the list bears no relation to the cameras
available in High St. stores today. Put it this way, none of the cameras
that I'm able to buy appear on the list!

BTW, which hard disk driver was installed when you were running
ICD2AHDI. I don't know whether ICD2AHDI requires an XHDI compatible
driver. The ICD driver is not XHDI compatible, or at best compatible to
a quite old level of XHDI.

IIRC WDialog started out as an extension to MagiC, which later on was
implemented in MagiC itself. Am I completely wrong here?

It's a free/open source font-engine that renders TrueType-fonts. It might
be used in fVDI some time in the future.

Papyrus's bitmapped fonts are pretty slow on my Falcon, which seemed to be causing the slowdown on my system. When I changed the font in the help file, it seemed to load much faster, and looked better. Or, you can just print the file and have a paper-based manual instead. For the most part, Papyrus is a great program. The only major problem I've found is that RTF files aren't done correctly (as far as I can tell). Whenever I save an RTF file, and then save the same file as a MS Word .DOC file, they are exactly the same, and the RTF file won't load back into anything correctly (AtariWorks, AppleWorks, and even Papyrus itself). When I contacted ROM about it, they said AtariWorks doesn't handle RTF correctly (I hadn't tested it on my Mac and loading it back into Papyrus yet at that point), and that they are supposed to be identical to DOC files, which didn't make any sense to me.

> BTW - Are there any other programs I should be looking at? I need a
> word processor entirely in English since I don't speak or read German.

Papyrus does have an English version. Another program I've heard is good is Tempus Word. I don't know if there is an English version or not. I didn't like the user interface on the demo, though. Quite ugly, and being a very visually and aesthetically oriented person, I found it very difficult to use.

Otherwise, there are no other really good, *modern* Word Processing programs out there to my knowledge.

> Couple this "mini ST" into the gut of a Neotari computer
> and... hmm.

Why not use an FPGA and emulate the whole ST in on one chip, complete with 68000 and the custom chips. Put it on a board that is generic enough to allow you to program the FPGA with a different "computer". Say you want to run a TT instead of an ST, just download the code for a 68030 and other chips....

Well, okay, things might be more difficult than that, but it would be possible. Also, I think it would be possible to make a CPU replacement with an FPGA. Write the code to emulate a 68030 and run it at 200MHz (with today's FPGAs). If you plug this into your Atari as a cpu replacement/accelerator, you could see some cool speed-ups....

Just a thought,
Chris

Hi,

Actually, creating a hardware platform, a new motherboard, is not a very good idea. It is possible to make a kickass Atari clone using emulation on a PC. PC hardware is very fast at a low price. A new atari motherboard would probably be slower and cost 10 times as much. All existing emulators tries to behave as ST-compatible as possible. What we need is a 68030+emulator and direct access to the PC hardware or custom emulated hardwarelayer. It should be compatible enough to run MiNT, or perhaps the other way around - MiNT should be adapted to work on the emulator. Perhaps there could be some application interface to access native x86 code too.

Screw emulation. Where's the Atari spirit in using a PC mobo and some crap emulation? I would pay 10 times as much for a new Atari mobo that has been created with just Atari in mind. I know, it's just my opinion and I'm sure this group is split into 2 about this issue. I find too many 'loyal' Atari users are willing to cop-out for a PC mobo and emulation and that sucks.

Joshua.

Well, so far, PhotoTip doesn't appear very useful. I can't get it to open any images. The help files are all in German. I think I've worked out that you need to open the Preview window and then select Slideshow, but when I select a directory that's full of images it jut says that there are no displayable images in that path! And I can'st work out how to select one picture in order to do all the wonderful editing that you're supposed to be able to do. Can anyone help?

I am also a "loyal" Atari user. I have lots of Atari stuff, a CT2 Falcon, a MSTE and an STE.
How come emulating an ST compatible computer on a Power PC processor is kosher, but emulating on a x86 is not? It is a bit like the Amiga-Atari war back in school. Before that it was C64 vs. the Spectrum. The Amiga and C64 guys used to kick the crap out of me every day.

Emulation does not need to be crappy, or suck, at all. Especcially if the emulated machine is adapted to the emulator, like in a "software clone" system. Most games, demos, older software etc, would not run on a hardware clone system anyway.

Personally, I don't care if the hardware platform is an x86, PPC, mini-ST, boosted Falcon or whatever, as long as it is a fast, stable, TOS compatible system, with nice expansion possibilities. Why can't we just drop the anti-emulation-on-a-PC-attitude and get _something_ instead of _nothing_?

TOSBox for instance, is far more compatible and stable than my CT2 Falcon, btw.

Regards

/Peter

Hey,
I never said that emulating on a PPC system was ok. I don't like the idea of MagiCMac either. I have MagiCPC installed on my PC at work just for fun but it just doesn't feel right. Like I said earlier, there is always 2 sides to this matter. I understand your point but I can't drop the anti-emulation-on-a-PC-attitude. I guess we'll just have to live with each other eh?

:) I guess.

I hope Motorola gets their finger out of their butt and release a fully
68000 compatible Coldfire. We use Coldfire in some stuff at work, and it is
very fast, and very cheap. At 66mz it's about as fast as a Pentium 75! For
an Atari, this would be very fast.

The window *is* resizable, but in a srange way. You have to set
the pixel size in micrometeres in the 'Window' dialog. And with
the 4th, 34rd and 2nd icon from the right you can switch between
the set 1:1 display size, or full height or full width.

>Once it's been polished up it'll be a "must-have", but ATM it seems to be more

Yes, I agree. Among other things four of the icons look the same in
mono resolutions - they don't in the manual and are OK in 256-colour.

None of the emulation is good in my opinion.. If u just want TOS only machine then maybe. Then say "I want fast TOS compatible" period. But ATARI is so much more as just TOS, it was diferent aproach machine, brought us new stuff, new ways.. and some emulator is that NOT!

> Most games, demos, older software etc, would not run on a hardware
> clone system anyway.

And those are not to be regarded as Atari software? Lets ban ALL non GEM and have a new "super Atari"? Is that the proper way? Before u start bashing me, im preety aware that there is NO WAY for 100 compatibility, esp for NON Gem stuff, but also lotsa of that could be realised. Take Milan for example, would anyone died or raise cost a lot if they would just add little YM on board? Or little ACIA for midi and maybe Atari keyboards?

Well i just prepayed to CT60... It is not perfect solution, but 060 is capable, PCI bridge is also announced and what i personaly prefer the best, original Falcons HW, such as VIDEL, DSP and so on, will stay in use, even 2 monitor systems easy possible.. Way better as emulation in my opinion. And old and specific apps will work, if not on ct60, in normal mode... Its not fancy/smancy 10GHz machine, but author deserve support! Bad point is, emulators are so much cheaper and can be copied for free, thats main reason.. "loyal" atarians dont wana spent money.. Look on emulations sites... U cant realy tell how legal they are anyway...

> TOSBox for instance, is far more compatible and stable than my CT2 Falcon,
> btw.

My CT2 is very stable.. And can u run APEX (u must admit, it is a lot better as any of GEM competition) on TOSBox? or Cubase (even MIDI only?) etc...? So its not very "Falconish" or "Atarish".

So that is main problem with emulation, u get soulless machine.. I will compare it again, as so many times: new VW "beetle" is way from being the "beetle" we all know, its sad joke and imitation..
I see "Atari vs emulators" in same perspective. When my pals came on visit i have something to show to them, something they can not have, something which some time ago writed computer history.. Something unique.
Final question: Why ppl buy Macintosh or PC, there could be one machine and emulating code?

Janez

Please, this is religion for you, right?

> None of the emulation is good in my opinion.. If u just want TOS only
> machine then maybe. Then say "I want fast TOS compatible" period. But
> ATARI is so much more as just TOS, it was diferent aproach machine,
> brought us new stuff, new ways.. and some emulator is that NOT!

Well, to start with, the "real" Atari computer is dead. The company is gone.
MiNT for example is still evolving. An Atari compatible using a virtual
machine with PC hardware would certantly be a different approach machine,
using new ways.

> And those are not to be regarded as Atari software? Lets ban ALL non GEM
> and have a new "super Atari"? Is that the proper way? Before u start
> bashing me, im preety aware that there is NO WAY for 100 compatibility,
> esp for NON Gem stuff, but also lotsa of that could be realised. Take

An old Swedish saying is "You must think further than your nose reaches". I
was talking about a machine with a future, with a modern OS like MiNT. Start
MiNT on your ST and run a couple of programs and see how compatible it is
with older non gem stuff.
We allready have Atari computers to run the older stuff.

> Milan for example, would anyone died or raise cost a lot if they would
> just add little YM on board? Or little ACIA for midi and maybe Atari
> keyboards?

Perhaps they focused on making a computer that people would actually use
instead of owning just for nostalgic reasons?

> Well i just prepayed to CT60... It is not perfect solution, but 060 is
> capable, PCI bridge is also announced and what i personaly prefer the

> Bad point is, emulators are so much cheaper and can be copied for free,
> thats main reason.. "loyal" atarians dont wana spent money.. Look on
> emulations sites... U cant realy tell how legal they are anyway...

I don't support piracy in any way. My interests in emulation is purely a
good clone, as I have staded earlier.
Authors deserve support if they make usable products. I think the CT60 is
usable, Rodolphe makes great hardware.
Old and specific apps? I have a falcon, and even in normal mode, I am unable
to run most "specific" apps, older games, etc. I use an STEEM to do this.

> My CT2 is very stable.. And can u run APEX (u must admit, it is a lot
> better as any of GEM competition) on TOSBox? or Cubase (even MIDI only?)
> etc...? So its not very "Falconish" or "Atarish".

Well, my CT2 is also very stable. I think it's a pity that APEX is not a nicely coded GEM program as it is limited to run on the Falcon. I use Cubase 5 on a PC nowadays, it was an horribly step to take, but it is much more powerful in every possible way. And no I cannot run them under TOSBox, but this is not a problem as there are far better alternatives.

> I see "Atari vs emulators" in same perspective. When my pals came on
> visit i have something to show to them, something they can not have,
> something which some time ago writed computer history.. Something unique.
> Final question: Why ppl buy Macintosh or PC, there could be one machine
> and emulating code?

Well I actually USE my computers, not just have them laying around to show my friends. Well, perhaps I do that with my Sinclair collection.

Anyway, my intention is to be constructive, and I feel that this discussion turned out to be the contrary.

/Peter

Hi Uwe,
I tried ICD2AHDI after booting with ICDPRO 6.5 then renamed ICDBOOT.SYS to ICDBOOT.SY. and ran HDDriver 8.04. Then renamed HDDRIVER.PRG to HDDRIVER.SYS. Rebooted, ran ICD2AHDI and got the same results: return to desktop after entering a # and hitting return. This was also tried after setting up HDDriver.sys with HDDriver.app and rebooting.
Side note: Each time I must rebuild the partition info with ICD's Cleanup.prg in order for ICD to see the 8 partitions. I go back to ICD since HDDriver is'nt seeing the 8 which is the problem we are working on!

Thats not entirely true, emulation on anything other than the ppc or g3/g4 cpu families is extremely inefficient. The main problem with emulators though besides the fact that you need a far faster computer than the one your emulating is its extremely difficult to take into consideration all the hardware, OS and variations in software. The only sucessful emulation I've seen is the apple Mac ppc machines that could run most of the old 68k code from the previous models.

A number of friends of mine from the now defunct user group I was a member of have switched to PC's and tried using various emulators to run their ST softwares. None of them has had any real success. The most recent has just switched and already regrets his decision, and he hasn't even shipped the TT to its new owner yet.

The short of it is, forget emulation, despite what rumor mongers tell you, it just doesn't work.

Peter,
as I've mentioned the idea of software emulation is laughable at best,
including tosbox, several friends of mine have tried it. Many of the common st
programs dont work with it, on many modern pc's it doesn't work at all. And
your bizarre assertion that its more stable than a falcon at running Atari
software is utterly stupid. Please don't waste our time with this, you're just
making a fool of yourself

Peter, its not "religion" as you claim but FACT, emulators just don't work nearly as well. Look at Darek Mihokas emulators as just one example, he's been at it for nearly 15 years, and yas yet to produce a useable emulator of any sort. Thats a worst case example. There are better emulators out there, but they still suffer from the same problem, you can't have pc hardware, a pc os (usually windows) then an emulator, and expect it to work properly.

A different approach doesn't make it a good one. The fact that atari is gone and they've not made computers is a totally bogus argument, C-lab did falcons, and the hades and milans were still available after atari left the scene. The rights to the OS and custom hardware could be acquired and machines produced.

> Perhaps they focused on making a computer that people would actually use
> instead of owning just for nostalgic reasons?
>

Did anyone claim to make an st clone for nostalgic reasons? Of course not!! that point is absurd. My ST & TT systems are used for 90% of the serious work I must do and my own amusement.

Neither do I, but most emulator authors and users do so indirectly since if someone sells their st and doesn't have the ability to dump the roms to disk for use with the emulator? That isn't even getting into the whole can of worms from emulator sites that either host pirated software or link to several that do. They're always the argument that its abandonware anyways but it does directly affect those few deveopers in the atari scene (some of whom do read this NG) and the chances that there will ever be a legitimate way of re-releasing the old software.

its not easy, but not impossible either. The point is to be able to use modern peripherals. Quite often I've seen external devices that have firewire interfaces or more commonly USB. 4 years ago when I got my scanner, SCSI scanners were not too difficult to find new at the time. Now its a different story, all the ones I've seen this year have been USB or firewire.

Thanks for the link...I checked out Mario Becroft's ide controller and the
link97
cable, the only difference I suppose apart from one being scsi and the other
ide is
that Mario's one has a TOS upgrade included and is a little more expensive.

Is the TOS upgrade really worth it? What advantages does the TOS upgrade
give?

thanks.

Let't not think of this as ST emulation. Lets think of it as clone emulation. Because emulating the ST hardware is very hard, as we need to support every little hardware hocus pocus or trick.

These hardware tricks does not work on the TT, the Falcon, the Milan, or the Hades.
Falcon specific software does not work on the ST, the Milan or the Hades.

Lets not forget that much of the software on the platform, is not compatible with higher spec machines. This is not the fault of the higher spec machines, but the software. Use of selfmodifying code, hardcoded memorylocations, undocumented optimizations (like the YM shadow registers - they cause a bus error on the Falcon), hardcoded interupts etc like using the MFP serialchannel on the Falcon, all of this is badly coded programs. These does not even work on all "real" Ataris.

When I said TOSBox was more compatible than my CT2, I ment for older ST software. Ofcourse the CT2 is a dream running MiNT/N.AES. And it is very stable. But not for older stuff.

I agee with you that the current emulation systems leaves a lot to be wished for, but they sure are a lot more compatible than my Falcon will ever get. 75% of all ST games does not work on the falcon, unless I use some kind of EMULATOR on it, then the figure is somewhere around 50%.

I have seen your previous posts about emulation, and you have allready proven your level in this area.

What is serious work for you, James? Is it low level programming? Is it hardware development? Where did you gain all this knowledge of yours?

Hi Janez,

Sorry it the earlier posts sounded a bit hostile; we both speak a language that is different from our own, this cause some nasty discussions sometimes.

I don't agree with you, but I get your point.
There is one big advantage with nicely coded GEM apps, and that is compatibility. But I agree, it slows things down a lot, and we cannot push the hardware to it's limits like we used to do.

>What new ways? Tell me ONE emulator which introduced those new ways? New
>ways as 1st Mac was, ST, Amiga, Acorn Next, BeBOX etc? Tell me one emulator
>which expand any platform to be better as real thing, introduce new ways
>to it, so far? What new horizons those emulators for all those platforms
>were opened by emulator? Or emulator just caused all those machines were
>in trash sonner as otherwise?

No, perhaps not "new ways" in that sense. Each of the existing emulators is limited in its way. But I am not speaking of existing stuff. I was looking for a cheap way to get a new Atari clone, using a new emulator of some kind. Our big rival, the Amiga scene, has joined forces a lot more than we have, I am afraid. They have taken big steps in their emulation technology, we haven't.

>Exactly. And emulate existing hardware is NOT thinking ahead! Hardware
>clone (look for clone in dictionary) with new capabilities, new stuff is
>thinking ahead. Problem of that is, i admit, cost which can be high.

Well, I see your point. An emulator system would not be looking ahead in that sense, but on the other hand, if the system is too expensive there would be no users. And the userbase, how horrible it may be, is shrinking, fast.
An emulator using new technology would meen users could actually get one. It could perhaps even stop some of the migration to other platforms.

>> We allready have Atari computers to run the older stuff.
>Yes, and even those all want to emulate. It so much fancier to run
>games/demos on STEEM which need fast PC, as on real Atari....

Ofcourse not.

>So with showing the really working Ataris, so they can see that work is
>posible on them as well, especialy since i run only Ataris for anything is
>worse as u showing them Steem or TOSBox, so they can get the impression
>Ataris are bad machines?

Ofcourse I don't show them Steem or TOSBox. I show them my serious music setup, with a PC, a Falcon, and a MSTE. And they do get impressed. But I hated when they called my Falcon a Super Nintendo so I have moved into a tower box.

>Yes, calling any disagreeing a matter of religion, making statements
>about my usage of computers (infact non usage, just make them lying arround

Well, I stepped over the line there. But read you own post again.

On Sat, 27 Oct 2001, Peter Persson wrote:

Hi, Peter,

> Please, this is religion for you, right?

Well what to say on such reply.. It aint a religion, its just more devotion or loyality to platform as u have. with a bit wider look on Atari as u have, whicn narrows down on runing GEM apps fast.. I was just showing my view, which i dont claim its only right one, i didnt bash anyone, but it seems that diference in mind is not welcomed here... that proved many times...

> Well, to start with, the "real" Atari computer is dead. The company is gone.
> MiNT for example is still evolving. An Atari compatible using a virtual
> machine with PC hardware would certantly be a different approach machine,
> using new ways.

What new ways? Tell me ONE emulator which introduced those new ways? New ways as 1st Mac was, ST, Amiga, Acorn Next, BeBOX etc? Tell me one emulator which expand any platform to be better as real thing, introduce new ways to it, so far? What new horizons those emulators for all those platforms were opened by emulator? Or emulator just caused all those machines were in trash sonner as otherwise?

> An old Swedish saying is "You must think further than your nose reaches". I
> was talking about a machine with a future, with a modern OS like MiNT. Start
> MiNT on your ST and run a couple of programs and see how compatible it is
> with older non gem stuff.

Exactly. And emulate existing hardware is NOT thinking ahead! Hardware clone (look for clone in dictionary) with new capabilities, new stuff is thinking ahead. Problem of that is, i admit, cost which can be high.

> We allready have Atari computers to run the older stuff.

Yes, and even those all want to emulate. It so much fancier to run games/demos on STEEM which need fast PC, as on real Atari....

> Perhaps they focused on making a computer that people would actually use
> instead of owning just for nostalgic reasons?

Well here shows how wide u think.. I have Falcon, and my pal has Milan and CT2 falcon is easily in same range as Milan.. Does a lot of stuff Milan can't, mostly does all other in same speed, but lack Milan's GFX speed and thats about all.. Milan as well has easier ways for ethernet etc.. where the nostalgic reson fit there? We both also run servers etc, so real usage.

Now about nostalgic reasons: i use my machines for all. I have cable modem, run MiNT, ftp/http/telnet/ssh servers, have local net, use nfs there. I can acces inet from other machines as server as well (ip masquarading). And i can run either Papyrus, or other gem apps, or Apex, Neon etc which are great apps.. Not restricted in any way...

> Well, my CT2 is also very stable. I think it´s a pity that APEX is not a
> nicely coded GEM program as it is limited to run on the Falcon. I use Cubase
> 5 on a PC nowadays, it was an horribly step to take, but it is much more
> powerful in every possible way. And no I cannot run them under TOSBox, but
> this is not a problem as there are far better alternatives.

When i meant stable i meant stable.. I can run 99% of apps i could run before.. I have no troubles in normal or both turbo modes whatsoever. I know that CT2 has some troubles on certain motherboards, i had luck there. Yes APEX could be done as GEM app, but would loose all power, a lot slower, lotsa of its capabilites would disapear. Authors didnt choose non gem aproach because they wouldnt like GEM, but to extract the most from the machine. And they succed, what Apex (also other similar apps) do on plain Falcon is realy good. Same goes for ST gfx apps etc..

> Well I actually USE my computers, not just have them laying around to show
> my friends. Well, perhaps I do that with my Sinclair collection.

Really, and what do u think i do? U realy are master of twsiting words. So with showing the really working Ataris, so they can see that work is posible on them as well, especialy since i run only Ataris for anything is worse as u showing them Steem or TOSBox, so they can get the impression Ataris are bad machines?

> Anyway, my intention is to be constructive, and I feel that this discussion
> turned out to be the contrary.

Yes, calling any disagreeing a matter of religion, making statements about my usage of computers (infact non usage, just make them lying arround doing nothing) is very constructive. Mind you, all i said was that i fell emulators are not proper way. I explained why i think so.. So i differ with your opinion, and thats i guess the reason u must pop up, and start to bash all over.. Constructive indeed.

Janez

The problem is that you're looking at the existing *hardware-emulators*
and say that they suck. I agree, they do. But what if a PC loaded a
68030-emulator that just emulates the actual CPU, and the OS (preferably
MiNT) was adapted to the PC hardware? Then you get a Milan with a
different, but much, much faster CPU.

>> Most games, demos, older software etc, would not run on a hardware
>> clone system anyway.

> And those are not to be regarded as Atari software? Lets ban ALL non GEM
> and have a new "super Atari"? Is that the proper way? Before u start

With a fast CPU you can easily run virtual ST's on the clone itself, thus
have a machine that's more compatible than even your Falcon.

> Milan for example, would anyone died or raise cost a lot if they would
> just add little YM on board? Or little ACIA for midi and maybe Atari
> keyboards?

I have a Milan now, and I prefer the current implementation. OK, it's a PC
with a 040, and that shows. It's a much simpler design than e.g. the
Hades, which the price-tag shows. I could never afford a Hades, even the
old-fashioned ST- and TT-hardware on it can't justify the costs.

Btw. the Milan emulates the MFP in hardware. Where do you draw the line
between Good and Evil emulation?

> Well i just prepayed to CT60... It is not perfect solution, but 060 is
> capable, PCI bridge is also announced and what i personaly prefer the

You are aware that you need to run a software-emulator on your CT60 in
order to run ordinary (non-060 aware) applications?

> My CT2 is very stable.. And can u run APEX (u must admit, it is a lot
> better as any of GEM competition) on TOSBox? or Cubase (even MIDI only?)
> etc...? So its not very "Falconish" or "Atarish".

That depends on what you use your Atari for. It looks like you say that if
you don't run non-GEM apps like Apex (which I haven't used for many years,
despite owning a Falcon) or are a musician, then you're not really an
"Atarian" (whatever that is)...

> sort. Thats a worst case example. There are better emulators out there, but
> they still suffer from the same problem, you can't have pc hardware, a pc os
> (usually windows) then an emulator, and expect it to work properly.

You're right. That's why you need to run e.g. MiNT as the *native* OS on a existing platform (x86 or Mac) with an emulated 68030. This will work just as well as a Milan or Hades, but it will be many times faster. The additional CPU power could be used to emulate legacy hardware when necessary, thus making such a clone not only much more powerful than any computer with a real 68k, but also much more compatible with older software.

> and the hades and milans were still available after atari left the scene. The
> rights to the OS and custom hardware could be acquired and machines produced.

Dream on. But if you actually want a new "Atari" I'm afraid the only realistic alternative is an existing hardware-platform with a 68k-emulator and adapted OS, or perhaps a custom hardware-platform based on common components and a cheap but powerful CPU (and a 68k-emulator ofcourse).

I recently bought a second-hand Milan040, and soon I'll hopefully have a 060 in it. It's a cool machine, but when I need more CPU and RAM (which I eventually will), there is no alternative to an emulated CPU. If the hardware doesn't evolve I will finally get tired and stop using my Ataris. My TT is rarely used. My Falcon with Afterburner, Eclipse and 64Mb RAM is now practically retired. I will also stop using my Milan in a few years, and I hope that there will be a more powerful alternative by then.

Must have been that time off, gave you time to think, dangerous. 8-)

Talking of hard rives, I was reloading a few hundred TTF's onto mine the t'other yonk, fontname crashed so I rebooted....

.... and have now lost the last 4 partitions of my drive, and magic is unstable as hell with what's left.

All part of a tidy up before backing up to CD. I could do with that backup now!!. 8-)

I agree with Christopher, I think too it's ok that Bravo Sierra posts here.
Bravo Sierra has great items (especially for the 8-bit Atari), the prices are
fair and he's a friendly and trustworthy dealer. I have ordered from Ben before,
it was an overseas deal without any problems, and I am sure I will order again
some day.

The Milan 1 is not "based on Intel parts" either. It contains one chip made
by Intel (the PCI->ISA bridge), the Milan 2 would have contained a similar
chip by a different manufacturer (which would not make much difference).

The design could have been shifted to a different chip, but that would have
been a complete re-design, and due to the already late date and the market
realities, we decided that would not make much sense anymore.

I do not know such a document. However, when packing it all into one chip,
all that matters is register compatibility with the original chips, and the
workings at that level are documented in several books.

:>which expand any platform to be better as real thing, introduce new ways
:>to it, so far? What new horizons those emulators for all those platforms
:>were opened by emulator? Or emulator just caused all those machines were
:>in trash sonner as otherwise?

: No, perhaps not "new ways" in that sense. Each of the existing emulators is
: limited in its way. But I am not speaking of existing stuff. I was looking
: for a cheap way to get a new Atari clone, using a new emulator of some kind.
: Our big rival, the Amiga scene, has joined forces a lot more than we have, I
: am afraid. They have taken big steps in their emulation technology, we
: haven't.

First of all, our big rival is not the Amiga scene. Why would it ever be?
Secondly, Amiga users don't fancy emulators any more than Atari users. I'd
even say they're less impressed with emulators than Atrari users are,
considering the success which MagiCMac has enjoyed in the Atari scene.

:>Exactly. And emulate existing hardware is NOT thinking ahead! Hardware
:>clone (look for clone in dictionary) with new capabilities, new stuff is
:>thinking ahead. Problem of that is, i admit, cost which can be high.

: Well, I see your point. An emulator system would not be looking ahead in
: that sense, but on the other hand, if the system is too expensive there
: would be no users. And the userbase, how horrible it may be, is shrinking,
: fast.
: An emulator using new technology would meen users could actually get one. It
: could perhaps even stop some of the migration to other platforms.

Though probably not. If you can run Windows apps, you'll often find
yourself booting into that environment instead. Consider how many people
have Linux or BeOS partitions. Then consider how many of those who are
actually using those partitions more than a few times a month.

:>> We allready have Atari computers to run the older stuff.
:>Yes, and even those all want to emulate. It so much fancier to run
:>games/demos on STEEM which need fast PC, as on real Atari....

: Ofcourse not.

Generally, you'll have to leave some luggage behind whenever you upgrade.
You had to with the Falcon, and even with the STE and different TOS
revisions. That's inevitable. The problem at hand is to see to that new
demos, games and apps are developed for the new platform, so that there

will be new upgrade difficulties in the future. =)

: Ofcourse I don't show them Steem or TOSBox. I show them my serious music
: setup, with a PC, a Falcon, and a MSTE. And they do get impressed. But I
: hated when they called my Falcon a Super Nintendo so I have moved into a
: tower box.

"Is that a keyboard or a computer?"
I know what you mean. =)

Exactely.

> Yes, i agree with that.. I kinda refer to clone or "new Atari" to
> machine which allows low level and some degress of non GEM as well. For
> TOS compatibles i just dont wana use the name Atari.. That does NOT mean
> that TOS only compatibility is necessar a bad thing!

Well, to be able to run GEM & Co, the machine needs to be low level
compatible to some extent.. and a lot of non GEM stuff would probably work
without trouble. It is not GEM / non GEM that is the "barrier". It is how
the program handles the hardware. But a level of compatibility equivalent to
a Milan or a TT would be a realistic goal.

> Yes i agree here, however, runing emulator u basicaly crawl in their
> (let say PC) technology, u dont use it as effective and u cant offer
> anything new.. That point dont make me particulary happy, thats all. I
> dont intend to blame or forbid the use of emus... Its just not same as
> real thingie...

CPU emulation technology today is very efficient. Dynamic recompilation, and
other nice things, actually makes it pretty fast. On a standard 350 mhz P3
or equivalent, you could have a lightning fast emulated CPU.
CPU emulation is not the problem, and it is not the reason for slow
emulation. The problem is emulating the rest of the hardware. Have a look at
a modern virtual Java machine. It is very fast, but it is, in a way,
emulation.
The system could be designed to allow applications to have access to native,
unemulated code. This way one could for example write new VDI drivers (for
fVDI), instead of emulating some video subsystem. This could even create
spin off effects for Milan, Hades, and Eclipse owners, in the form of
drivers for different hardware.
Even virtual memory management could be done on the host platform.

> that im utterly wrong here.

Personally, I don't use MagicMAC or MagicPC, as these only emulates a 68000, has no memoryprotection, and emulates too much hardware. It is not as "native" as I would like.

Also, I am afraid you are wrong about the 060. The 060 is missing some 68000 instructions, and these need to be emulated for compatibility.

The PPC kicks ass even when emulating stuff. I promise. It is an extremely efficient RISC processor.

> yourself booting into that environment instead. Consider how many people
> have Linux or BeOS partitions. Then consider how many of those who are
> actually using those partitions more than a few times a month.

Good point. Let's boot with FreeDOS and run it as native as we can.
Defenitely Microsoft free too. Great.

> Generally, you'll have to leave some luggage behind whenever you upgrade.
> You had to with the Falcon, and even with the STE and different TOS
> revisions. That's inevitable. The problem at hand is to see to that new

I was actually a bit dissapointed when I got my Falcon. For some reason,
they decided that DMA freg 6.25 khz was now "mute", but even worse was the
removal of the YM shadowregisters. They could have kept the shadowregisters.

BTW, would it not be possible to connect something to the bus slot that
removes this problem? Or at least stop the bus error?

> : setup, with a PC, a Falcon, and a MSTE. And they do get impressed. But I
> : hated when they called my Falcon a Super Nintendo so I have moved into a

Don't you just hate when that happens?

A guy said - "Oh! You have a C64! Great! Do you remember Great Giana
Sisters?". Hate it. Hate him. Especcially as I had a Spectrum, and the C64
used to beat me up just because of that. They said: "The graphics SUCK on
the Spectrum" and I replied "NO! And it is a lot better for programming" and
they said "The spectrum only has 48K of memory! The Commodore 64 has 64K!
The Spectrum SUCK!" and I replied "I have microdrives for my spectrum and
thats a lot better than your taperecorder" and they said "Well we have
discdrives with discs the size of a frisbee! Beat that if you can" and then
they beat me up. Then I bought an Atari and said "Ha! The 64 SUCK!" but they
replied "I have an Amiga and it can display 4096 colors AT ONCE and in
INTERLACE!!" etc etc etc etc etc How did I end up here?

> Vi m�ste vara r�dda om varandra
> - det �r det enda reciproka pronomen vi har.

Och den d�r raden diggar jag skarpt.

mvh

It's just a throw back to the 80s. Believe it or not, there used to be no commercial posting to the newsgroups w/o having your account/access denied. This was back when it used to run from a lot of educational institutions.

In order to provide the commercial a place, the .biz hierarchy was created. Naturally the businesses refused to post there because no one used them, buy a clue kind of thing.<grin>

But these days, everyone has given up. I think it was former VP Al Gore who championed the commercialization of the internet through some of the funding changes he made while in congress and money is no longer a dirty word. That is the reasons for commecial posts were illegal as the internet was run from universities and government funded kind of thing. Times changed.

Well, not quite everyone as we saw here. I have.

Hi Pascal,

>That's not true. I got the Runtime error message with MagiC 6.10.
>As other people, I also have a 68000 error (2 bombs ?) with a lot of
>files.

I'm convinced that these are files that contain a lot of pages and pics,
Porthos "eats" memory. I've tried to load a 11MB PDF file and even 128MB
internal memory wasn't enough...
The first rule to get Porthos running error free is to make sure that you
use a system with lots of free memory, a standard 4MB system is no good,
and I have very strong doubts about a 14Mb Falcon as well...
I only use the demo so I can't verify this, but I suppose that Porthos
(tries to) load the complete document at once.

>I tried with Tos to "see" the bombs but the program complainted
>about WDialog not installed (but it IS installed, v2.04 iirc).

The current version of Porthos doesn't run under TOS at all.

>On some files, the display is not quite correct (compared to GemGS or
>Acrobat reader) but it's not too bad for a beginning imho. Speed is far
>better than with GemGS.

You need to put additional Adobe Postscript fonts in the NVDI Gemsys
folder to get better results... the ones supplied with Porthos are very
basic to say the least. Be warned however that using extra Postscript
fonts will push the memory consumption up even higher :-/
Although screen output could be a lot better, the output to paper is very
good. Comparing the output to output from Adobe Acrobat there's hardly any
difference...

Cheers from Belgium
Dennis

>sick of AtariWorks. Does anyone know if ROM or anyone else had
>converted the enormous Papyrus help files to any sort of useful
>format? Loading the help file on my TT takes ages in the demo.

The help files are a new implemented feature of version 8.xx, previously the docs were in the STGUIDE HYP format. Why they decided to get rid of the HYP file help system which was very fast and replace it with this clumsy system is something we'll never know. Unless you're running Papyrus on a fast clone or with an Atari emulator on a PC or Mac the help system is dead slow, and on top of that it's full typos as well and contains incorrect information...

>BTW - Are there any other programs I should be looking at? I need a
>word processor entirely in English since I don't speak or read German.

Depending on your needs, Cypress could be a good choice. It's freeware now and an English translation is available on the DDP website (see sig).

Cheers from Belgium

I have a Mega STe internal host adapter (Atari) that is
non-functional. Can anyone tell me the common failures of this board or
suggest a diagnosis procedure. The most obvious symptom is that the hard
drive does not spin up and is not recognized when connected to this card.
I have a second card and the hard drive works fine when connected to it.

Hard drive should be swiched (jumper) to SCSI ID0
Also PARITY must be switched of and most of that adaptors doasnï¿½t like
an terminated SCSI bus.

-> DOITST

There is *no* operating system for the Atari that supports *TOS
compatible* partititions (i.e. partition types GEM and BGM) of more than
1 GB. Larger partitions are only possible with other partition types, in
particular F32 or LNX.

I agree. But I want to see a demo working on my system first. I'm using MiNT. I'm sure Magic is a good system too, but I don't need 2 operating systems.
But this thread makes clear that may Atarians have been waiting for a PDF viewer that's easier
and faster than Ghostscript. PORTHOS deserves all the support we can give.

4440. Amail + OLGA + Memory Protect ?

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 09:32:31 UTC
From: nospam@zonnet.nl
Message-ID: <PgQC7.1510$x31.12343@zonnet-reader-1>
Source record: 41061

When I run AMail on MiNT with memory protect, I'm getting a MEMORY VIOLATION with a message that the process OLGA is killed. The result is that I can't write any messages then. No problems with memory protect off, but it's my wish to be able to run all my main programs with memory protect ON one day in the near future. Is the problem I'm describing caused by Amail, OLGA, or MiNT ? or is it just MY problem ;)
I rembember having a similar problem with Aftp, but I haven't used this for some time and don't know if things have changed since then.

Many older programs don't run with memory protect ON, but Amail is not an old program. I've also tried Mymail. Amail and MyMail are equally good, but I'm prefering Amail. MyMail's nice graphics, dialogs, and built-in editor give it good looks, and it has a lot of functionality, but it's also slow. With Amail and QED I can work much faster.

NEWSie, used to do this posting, seems to be very unstable with MiNT, no matter with MP off or on. I'm only using it with single TOS and STiNG or STiK. In fact I'm looking for a better NEWSreader/writer to use with my MiNTNET configuration.

Martin Tarenskeen

Well iwe seen Mac and PowerPC in emulation (cpu only) mode and it was
crawling.. I realize that new PPC's are a lot faster, still emulation is
wasting of power.. Imagine native PPC code on let say G3, and then same
app in emulated mode.. That machine would be faster of existing ones (i
wonder how much compared to 060) but still crawling compared to what that
CPU can do... It leaves bad taste...

> CPU emulation is not the problem, and it is not the reason for slow

I know, add that to what i said above...

> The system could be designed to allow applications to have access to native,
> unemulated code. This way one could for example write new VDI drivers (for
> fVDI), instead of emulating some video subsystem. This could even create
> spin off effects for Milan, Hades, and Eclipse owners, in the form of
> drivers for different hardware.

Yes, that would help, but then u need OS designers and programmers
familiar with PPC or Intel to actualy write that.. etc

> Personally, I don't use MagicMAC or MagicPC, as these only emulates a 68000,
> has no memoryprotection, and emulates too much hardware. It is not as
> "native" as I would like.

Well i use it from time to time.. But my CT2 is faster as 040 MacIntosh,
and also i like to use some specific apps on daily basis (sndplayer, etc)
so enjoy much more on Atari :)

> Also, I am afraid you are wrong about the 060. The 060 is missing some 68000
> instructions, and these need to be emulated for compatibility.

Oh yes, i know that.. But my priority is on CT60, not Hades or other 060
clone. CT60 works on top of Falcon, which means hardware compatibility
will remain, even for HW dependable apps, in worst case some will require
normal mode. But when u add PCI host to CT60, u get really nice machine
infact, AES in high res on GFX card, and at same time virtual consoles on
Falcon video output.. Same way apps like Apex, Neon, etc runs as well, and

music apps (sndplayer, aniplay, famp...) On other hand, whole machine wont be much slower as Hades for example.. i really like that idea.

> The PPC kicks ass even when emulating stuff. I promise. It is an extremely
> efficient RISC processor.

I dont doubt... But i have 040 Mac (540c), my pal has PPC Mac (i think it 603, not sure at 100 or 120mhz) and MagicMAC on my machine beats hell out of it. I also saw MacOS stuff crawl on PPC so im still skeptic a bit. Also to run apps 2-3 times faster on some fancy G3/4 as on poor 50-60Mhz 060 it looks like joke to me :))

Yes, but it would have the advantage of existing at all. Also, just imagine the speeds available in a couple of years. And, everyone could have it, as it could be free. So, the ones that unlike you and me are willing to spend a fortune to keep using their Ataris, could actually do just that without paying a nickle.

Also, for some reason, girls does not get impressed by hardware hacked Atari machines. Why can't they be like the rest of us? A couple of demo screens, a look on the CT2 inside, some YM music - this is great foreplay if you ask me. :-)

/Peter

Hm, i dont actualy.. I just run few apps (i have ct2, but i dont tell them that) in TC. When they see mp2 playing together with all 3 demo effects from GemDemo, and animation (avi) in Aniplayer (in scan mode, so dont shutdown the mp2 replay) and irc etc in virtual consoles i hand them Falcon booklet, so they can wonder ;) (well compared to 500-1ghz clocks today, my change from 16 to 50 seems like nothing). And believe me, they do wonder :) Btw, if u wana snapshoot of that desk just say :)

It's a problem with aMail. You need to set it's MP-flag to Global, this
also applies to asock.prg.

There is another problem with aMail (atleast with the current version)
that manifests itself with MP enabled. asock.prg is killed because of a
memory violation just before it exits. This is most likely a bug in
asock.prg that could very well cause serious problems without MP enabled.

Do you have a shell-account somewhere? If so, go there and run tin or a
similar news-reader. I like tin, it's powerfull enough for my needs and
very fast. Running the news-reader remotely also speeds up things, saving
huge amounts of downloads.

The directory I've chosen is full of JPGs! Mostly created with
Imagecopy. One thing I did notice is that when you select a directory
via the File Selector, it automatically adds "*.*\" to the path
returned to PhotoTip, i.e. F:\IMAGES*.*\ so maybe that's what's
confusing it. I also assumed File/Open would open an image, but
selecting a JPG brings up a dialog box "Can't read an image file".

Apparently because ST Guide is a dead format and no-one uses it any
more! Also, I think they wanted to show off the hyper-linking
features of the Papyrus format, and include images and screenshots.

Thank you. It works! I also tried setting the MP-flags to Readable and this also works.
If I understand well, this is even better, since it offers at least some memory protection
?

Does anyone know of a free, stable, unix shell or msdos or entirely new
interpreter system
for the Atari ST that installs on a single floppy (or perhaps two) and
provides normal command
interpreter functions?

4451. VGA monitor on Atari ST?

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 12:08:07 UTC
From: Dan S <cjh3@hotmail.com>
Message-ID: <MvSC7.6298$c5.66682@newsfeeds.bigpond.com>
Source record: 41069

Anyone know of any way to allow a VGA monitor to display the video of an Atari ST.

I know a multisync monitor can display the video, but I'm thinking of doubling the output
frequency like an amiga 'flicker fixer' but for Atari (for display on VGA at VGA frequencies).

Any one know of such a device?

4452. Re: Mega STe Hard DIsk Controller Repair

SCSI ID and parity are correct since the hard disk works fine with
the second card that I have. The hard drive is the original Seagate
ST157N which came in the computer.

OK, so what's the best way for a guy in USA to get HDDRIVER? As you may have heard, we're having a bit of trouble in our postal system right now, and I don't know what measures they might take to combat it. There's talk of radiating mail to kill possible anthrax spores, and it seems to me that might not be good for magnetic media. It would be ever so much easier if there was a place I could go to download it, and pay with a credit card.

4456. TOS Programming in assembly

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 14:09:01 UTC
From: Dan S <cjh3@hotmail.com>
Message-ID: <fhUC7.6387$c5.68298@newsfeeds.bigpond.com>
Source record: 41074

I'd like to program in assembly (already being an 68000 assembly programmer)
and
so I would like to know if anyone on this ng has any links, faq's or other
assembly programming
docs for the ST.

Who knows, maybe I'll release some cool utilities for the platform soon....

Thanks in advance for any help.

This option seems the best....it is portable too.

How much effort and configuration did the link2 reqiure to set it up
on your STe? Also, what did you do to set it up?

What tos are you running in the STe?

4458. Cubase >> Roland sysex question

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 15:12:00 UTC
From: Matthew & Caroline Simpson-Morgan <mellotronic@hotmail.com>
Message-ID: <3BDC203F.9BC11CD5@hotmail.com>
Source record: 41078

Hi,

if anybody is familiar with Atari Cubase and using the Midi Mixer - I have a problem that has me fairly stumped: I want to create an object on the Midi Mixer to use as a 4-position slider (0-3 in value), which will set up the output of individual parts in a sound patch (dry, reverb, chorus, direct).

The thing is, to set up the sysex string requires a checksum for use with my Roland U20 synth. What do you use as a checksum for a sysex VARIEABLE value (ie xx)? If I leave the checksum out, nothing happens on the synth... if I put one in, the synth always says "checksum error!" (and I don't know what checksum to use anyway, since the variable value will make the sysex total change from settting to setting).

I'd appreciate some help if anyone can.

Thanks, Matthew.

4460. Misc ST Items FS

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 15:21:38 UTC
From: fmhcom@operamail.com
Message-ID: <6oVC7.93$FH2.77712@newsfeed.slurp.net>
Source record: 41079

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

---
60 Meg SCSI external drive in a nice 9.5" x 9.5" x 2.75" case.
Has 2 SCSI 1 connectors allowing passthrough.
Comes with SCSI 1 cable. $60.00

Syquest 44 drive with 1 44 Meg Cartridge and ICD Link.
Drive comes in nice shoebox style case with integraded ICD Link
allowing simple plug and play to ST, STe, and TT. Comes with one
HDX formatted 44 Meg cartridge. There is room for a second
hard drive or even a CD-ROM drive. Has a male SCSI 1 connector
cable already wired. $100.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

Bridge 4.0 by Artworx. Play the card game Bridge on your ST.
Comes with disk, docs, and box $5.00

Renegade by Mastertronic. A space shooter type of game kinda
like Star Raiders? Comes with disk and docs. $5.00

Captian Blood by InfoGrames. A Space Adventure game. Docs state
"This software explores a new concept, the BIO-GAME. The characters
can evolve, be born, die, trade information and generally get on
with their own independent lives." Comes with disk, box, and docs. $10.00

NightBreed by Ocean. This is from Clive Barker's Nightbreed story.
"Make your way through the caverns of Necropolis to the underground
city of Midian and where Nightbreed creatures dwell." "This all
action adventure allows you to shoot, punch, and jump as you
explore the terrifying underground environment of Nightbreed."
comes with disks, docs, and box. $10.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.

For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

MAGAZINES

I am working on a huge list of Atari and Classic Video Game/Computer
list. Please E-mail on what I have at the moment.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

Well, things have changed since before I got on the interNet. My first
host was a commercial provider, and anymore, all my e-mail
correspondents log in through commercial providers. Also, all the web
sites I hit are run by or have space provided by a commercial enterprise.

And there are not as many people from back in the 80's still running
things as there was. And I am sure the attitudes of those from the 80's
still running any parts of the interNet have evolved along with the
interNet to where commercialization is not frowned upon like it was.

The only points where I see the old standards still in force are the
moderated newsgroups who have properly selected moderators who handle
their moderation assignments properly (only group I can site is
rec.food.recipes).

I should also point out that I have been following this thread though
rec.games.video.marketplace, a group that is decidedly commercial in
nature.

Message-ID: <PCVC7.256$vT1.15339624@news.incc.net>
Source record: 41081

What we must all realize is that there is no way we're going to be able to keep "Atari" alive. The company is dead. The name is dead. The "spirit" is dead. No matter what we do, either we try "reliving" the past (via emulation) or we move on to another hardware platform entirely.

However, there is a way we can "bridge" this no-win situation. If we use emulation to help *transition* a ton of Atari software from the old, outdated to the new, updated!

First we start with a CPU that has to be unique, with a ton of potential, power, and a lengthy lifespan. That would be PowerPC. It can be anything from a 603e to a G4 presently, but we need to think "affordable". I doubt many existing Atari users, not to mention ex-Atari users, would be willing to spend more than $1,000 on such a computer associated with "Atari", in any way. You can buy PC's and Macs that are leading edge for not much more.

But the "edge" we're using is the fact we prefer the Atari software "look and feel" over PC/Mac alternatives.

Why else do we still use Papyrus? Or 1st Word? Or any old ST software that is probably so far behind the times, it's not even funny? Because we remember how much we loved it when it first came out! How much fun we had. It's all about nostalgia, isn't it? Wishing we could relive the 80's, when the ST was in it's prime!

Well, if you think about it, we can...

We use emulation to allow us to use old ST software on new hardware. We then locate as many of the programmers of the software we love and bring them back to them port the software to the new hardware/OS/GUI. Sure, it won't be GEM (although it probably could be made to resemble it, if not even better!), but it will be multi-tasking and have memory protection and a bunch of features we never had in the old ST's, except through MultiTOS to a certain degree.

When the apps are ported, we now have a new computer than runs the old apps *and* gives those apps a new road to run on, where they can be upgraded and improved, because now there is a company who stands behind it's hardware/OS/GUI and offers, not the weak promise of stretching the old road a few miles farther (the old road has long since run out of pavement... Atari users have been off-roading it for years now), but offer to carry the luggage if they will simply turn onto the new road paved especially for them.

There is no way to get around it. If we want to actually *survive* in this PC/Windows (or Mac) world, we HAVE to be wiling to evolve. We can't keep the name. We can't keep the hardware. We can only adapt to our new

reality. And that reality does not carry the Atari name, nor the Atari hardware or OS. It carries the casket to the river, allowing us to... "accept that which we cannot change (the death of Atari) and the courage to change that which we can." and celebrate the fact that we *do* have the beginnings of a future to go into by accepting the end of the past that we've come out of.

Yes, you can run emulators and use your old ST's and continue pretending you're actually getting somewhere, or... you can use emulation technology to actually GET you somewhere!

Afterall, it comes right down to it. We use software, not hardware, to get things accomplished. The hardware/OS are simply a means to an end. It's the software (apps) that are actually the destination. Hardware without software is... DEAD!

The simple truth is, as long as no one takes a stand and actually supports this "transitionary computer" I speak of, and helps bring the apps from one side to the other, we will NEVER get anywhere and Atari users will continue to fade away in the past until there is nothing but whisps of dust blowing in the breeze.

But we must do these things:

1) Stop arguing over emulation issues.
2) Start believing that "transition" (via emulation) is the only way.
3) Start working towards the new future!

Jared

Source record: 41082

Frankly, creating a new platform is the *ONLY* way to save what we consider the "Atari Experience". Sadly, however, it won't have the name Atari, or be made by Atari or even use GEM any longer. It will, however, emulate an Atari, at least so far as making "transition" to the new platform easier by making it possible to run and port ST applications on the given system.

We can only salvage the software. We must leave the rest behind, for it is dead and antiquated. Would you rather run your favorite apps on new hardware, with the potential of upgrades and improvements or continue using your aged ST apps, with no future?

As much as we'd like to have our cake and eat it too, that will never happen. We must accept that and realize, if we are to progress, we must leave what we can not take with us... and that is the legacy hardware and the OS that ran on it.

WOLF... the future of Atari computing... if we allow it to be.

Jared

Hi Dennis.

Another Good thread.

It's amazing the discussions that occur when something NEW is
released.

There are alot of messages in this thread, so perhaps I missed part of
the discussion.

I was just wondering, is their a technical reason why Porthos could
not be adapted to single tos? Right now, if I were to get this progam,
I believe that I am short of memory in my TT. I have 4 meg TT and
2meg ST. My STs only have four meg. These are my computers running
Magic. My Falcon with 14 Meg has never yet been able to accept Magic
of any version:-(. So it runs Geneva.

So from what I have breezed over in this discussion, I don't believe
I could use Porthos At this time?

Later Brian.

I am asking for a different purpose- i.e. the fun of hardware hacking.
For that it would be handy to exactly know the functions and relationships
of all those signals on, say, the MMU.

Yes, I'm fully aware of these problems ...
You should ask the guys from System Solutions, who distribute HDDRIVER
with an English manual (from me you would only be able to get a German
manual) whether you can pay with credit card. They might also be willing
to send you your version of HDDRIVER by e-mail. If not, I can do that,
but remember that if you order from me I can only send you a German
manual and you would have to pay in cash.

4469. Analogue synthesizer emulator.

Newsgroup: comp.sys.atari.st
Date: 2001-10-28 19:15:00 UTC
From: Crackers <bcracknell@sympatico.ca>
Message-ID: <4OYC7.2283$Fy2.198957@news20.bellglobal.com>
Source record: 41088

Has anyone ever written one for the Atari ST? It doesn't seem like it would be all that hard to turn an ST in to an emulated midi analogue synth module. The ST has what, three oscilators I think? Stack the oscilators for a nice beefy analogue mono-synth sound. Set up some virtual knobs/sliders on the screen which can control the ADSR of each oscilator and an envelope generator for the filters, then have the whole thing controlled through MIDI. You could even make velocity switchable on/off to further emulate old analogue synths. Something similar to Microsynth 2001 on the C-64 except controlled through MIDI.

There's lots of MIDI software for the ST where it controls other MIDI synths but I don't seem to recall seeing a lot of software where the ST itself is the synth. I think I've seen one where the ST is turned into a midi controlled sample-playback drum machine and one where the ST is turned into a midi controlled sampler.

Oh hey! You could probably make an analogue drum machine emulator for the ST that synthesises the drum sounds instead of playing back samples.

I've got about a dozen Atari ST computers and I was thinking it would be neat to make a song where not only is all the sequencing being handled by an ST, but all the synths used are actually Atari STs as well.

Granted the ST has a horrible S:N ratio.

Speaking of which... has anyone ever worked on ways to improve the audio-out on the Atari ST? Maybe instead of taking the line out from the DIN jack there's a place on the ST where I could pull the audio from where it's a little cleaner and then run it through a higher quality pre-amp?

The only thing alive at the moment i can think of is ACE, a falcon
project.
The problem isn't with the oscillators, it is with filters. Any good
analogue synthesizer needs some filtering, and his takes at least (from
my head) 6 fixed point multiplies and 3 adds per oscillator cycle (2nd order IIR
filter)
Trivial on a DSP processor, but quite a load on the poor old MC68k.
The 2nd problem is that you can not use the oscillators on board the ST
for digital filtering since they are outputted directly, not in digital
form.
The next best thing on ST is SIDvoice composers, which there are some around,
if you check on the web.The use some tricks to reach the same effect.

Come to think of it.. it may be possible on ST with some tables, and
limited filter ranges. Who knows, i might get back to you on this one,
but then again, i already put a TB303 emulator on indefinite halt because
of the lack of time to make a decent user interface, and
calculate/finetune the envelopes.
midi control would be trivial to add ofcourse.

> settting to setting).
>
> I'd appreciate some help if anyone can.

I don't use Cubase but .....
When you send a SysEx message to a synth, you want it to do only what
you ask and nothing else. If a SysEx message gets corrupted during
transmission to the synth, it is entirely possible that it could
become a totally different (but valid) message! So a reverb change
could conceivably become a GS Reset!!
To avoid this, Roland uses a checksum that is calculated using the
address and data parts of the SysEx message, thus ensuring that if
the address or data is corrupted somehow, they will no longer match
the checksum and the SysEx message will be discarded.
Calculating the checksum follows a simple formula which is easily
learned and applied. Following this formula will guarantee correct
checksums:

1. Convert the hex values to decimal.
2. Add the values together, but if the answer to any sum exceeds 127
then subtract 128.
3. Subtract the final answer from 128.
4. Convert the resulting value back to hex and use as the checksum.

Here is a practical example:

[1] [2] [3] [4] [5] [6] [7] [8] [9]
F0 41 10 42 12 401100 4163 0B F7

The checksum is only calculated from the address [6] and the data
[7], thus we need only look at 40 11 00 41 63 in this example.

1. Convert hex to decimal:
40h = 64
11h = 17
00h = 0
41h = 65
63h = 99

2. Add values, keeping result under 128:
64 + 17 = 81
81 + 0 = 81
81 + 65 = 146 (146 - 128 = 18)
18 + 99 = 117

3. Subtract answer from 128
128 - 117 = 11

4. Covert to hex:
11 = 0Bh

Part [8] is the checksum and is indeed 0Bh in this instance.

The manual Roland shows a different method which involves slightly more complicated arithmetic. If you prefer this method then by all means use it.

In essence it involves adding all the values together, dividing by 128 and subtracting the remainder from 128. Thus:

1. Convert hex to decimal:
40h = 64
11h = 17
00h = 0
41h = 65
63h = 99

2. Add values:
64 + 17 + 0 + 65 + 99 = 245

3. Divide by 128
245 / 128 = 1 remainder 117

4. Subtract remainder from 128
128 - 117 = 11

5. Covert to hex:
11 = 0Bh

Hope this helps.
Regards
KapMaN

Somewhere in this thread the problem of memory has been mentioned. So I wonder...

Is the virtual memory program, Outside, still available and supported? Maybe that program, or other virtual memory management program, would solve that problem.

I'm just speculating here, since even Windoze uses VM.

The following is just my opinion, please feel free to simply skip this post if you wish.

This is for those people who are complaining about any commercial posts in the newsgroup.

Here are some points to consider:

1. Everyone here is interested a computer brand that no longer manufactures a computer. In fact, the company no longer exists.

2. The last new computer introduced by the company was in 1993.

3. What new computers that are available, such as the Hades and the Milan, are just updated versions of old technology and an old operating system. Magic, MiNT, Linux, will not keep this platform alive. You need a genuine manufacturer with a solid financial base that can afford an advertising budget to do that. Even then, you may be in a very niche market, Sun Microsystems comes to mind when talking about a niche market.

4. There is no dealer base that exists, at least in the United States, anymore.

Whether or not you like Bravo Sierra Computers or any other dealer, you ought to be thankful that someone is trying to fulfill a need for this platform, that need being a source of hardware and software rather than complaining about commercial posts in this newsgroup.

Some of the comments I've read in this thread and others are, IMO, absolutely childish. I used to be very proud of Atari owners, but these days I'm ashamed of them. This newsgroup has become the de facto source of Atari information and support today. Even though I firmly believe there is still a place for a simpler computer like the Atari, I do not recommend the platform to anyone anymore because of the way people behave in this newsgroup.

There are a number of individuals in this newsgroup who should look at themselves in a mirror, and ask themselves if their actions present a positive or negative impression of the very few Atari users left.

It may be because STGUIDE wasn't a standard. I know I never really understood how to make it work reliably. And I never had an English version available either.

At least by making it a PAP file, every user knew that HELP would work. And it has been pointed out here, and if I'm not mistaken in Papyrus documentation, that loading and saving the HELP file speeds up the operation. And if the typos and incorrect information bothers you, you have the ability to fix the errors.

Try fixing the errors in a Windows online help file! LOL

> Depending on your needs, Cypress could be a good choice. It's freeware now
> and an English translation is available on the DDP website (see sig).

When Atari was truly a viable platform, I used to buy almost every productivity program out there that interested me. I've never heard of this one. :-(

If you pull out pins 3,4 and 38 of the Yamaha chip you can get at the 3
channels. If you take these to a line input you may get a very good sound
with better S/N. Not sure what level they are at though but you have 80%
chance they are line level.

There is no vendetta and its not a personal issue, and its as relevant to
this base as are commercial advertisements in this non-commercial base.

Dead format, I dare to say its the most popular, I have 10's of dozens of
.HYP files and all from recent applications.
And you can catalogue HYP files into a common index that makes finding a
reference a piece of 'p', try that with ROM's effort.

If it wasn't for the multi page dribble he posts each time, imposing himself on my phonebill, then I wouldn't mind so much. Other people can do it with a 4 liner, "Visit my Website at" will do no harm, and get him in the public eye, and I wont have to pay for it. Some people seem to forget that in GB we pay by the second for our IP.

Here's what's new this week at TAT!

* NEW! Name that Game! Win prizes!
* NEW! Atari Karts Review
* NEW! New 7800 and 5200 review forms added! Send in your scores!
* NEW! Guides page added (We need more guides from you!)
* NEW! Vote for the most recognized video game company of all time.
* NEW! Adopt-A-Page Program! Advertise your business on TAT!

* Revisit My Most Hated Jaguar Games

The Atari Times is always looking for new material written by you! Yes, you can earn cash for your written work! (How many other websites do that?) Also, we're desprately looking for great articles and reviews for Atari ST and Atari 8-bit computers. If you have a craving to write something about Atari, The Atari Times is your first stop for getting your work web-published!

I picked up Outside v3.51 from the author's site a while ago. It's in
German and I think it's now Freeware (copyright retained).

The author is a certain Dr Seimet... B^)

EBay might be a source of smaller drives.
The external port of the MSTe will access bigger drives, of course,
with the use of a different host adaptor. The problem is the Atari
host adaptor - not the MSTe itself. (Just for emphasis...)

You shouldn't use Warp 9 with NVDI - they both try to speed up the
screen but do it in differing ways (Warp 9 has compatibility issues).

NVDI's CPX has its own screen accelerator.
I don't use screensavers - just the screen blanker in MenuInfo

Maybe someone who has used Porthos will download Outside and give my idea a try.

And when I have the time, I hope I remember Outside is now free, and I'll download it and install on my TT. Might even try it on my Hades. <G>

Steve,

Your hole reasoning and tone in this thread is an insult. Ben isn't "using" anyone. He's an atari user, who runs an atari related business. You have NO right to attempt to blacklist him from posting the occasional message. He isn't posting hundreds of messages. He isn't posting anything thats not atari related. Your inept arguments have no basis in reality. END OF STORY!!!!

btw, I haven't seen you complaining about the numerous ebay ads popping up in the atari newsgroups or the regular wanted / for sale ads from others. Its got me wondering just what kind of grudge you've got against Ben. Frankly I'd have no trouble to buy anything from him and I plan to do so where as seeing your own character I certainly wouldn't trust you in any matter where money was changing hands.

Hey Jo

What you said is in fact the exact opposite of what my and other experiences have shown to be true. Truth is there is now way to run all the old and new software on an emulator, it still hasn't been done even after years of trying. To date there has only been one really good example of one system emulating another, ahnd that is the PPC & G3/G4 macintosh systems emulating the earlier 68k macs. Try to run 68k based Atari stuff on an x86 system running windows is still an outright absurdity and a waste of time. And its not the intent of the proposed project which is to build a modern and compact ST, not just another windows whitebox running a second rate emulator.

Au Contraire Jo!

in fact quite the opposite, my post secondary education deals entilerly in electronics as does my work experperience. You see I *DO* know what I speak about. And my statements are in fact not ignorant or arrogant in the least. I deal in hard FACT not fantasies, What Peter and yourself claim about performance of emulators is nothing but fantasy.

Put simply it goes to credibility, and mine is quite solid.

I think Marios board has TOS 2.6 on it. I haven't used it much even though I do have a 520ST upgraded to 2.6, at bootup it does feature a memory test and a delay for a hard disk to spin up to speed. it also supports 16mhz clock speed and the high density floppy on the Mega STe computers (although not all the mega ste had the HD floppies though). I cant remember what else at the moment.

FLOPPY 3.5" Oceanic America Master-3S external floppy drive, incl floppy $ 28
cable and power supply

FLOPPY DISKS quantity 10 DSDD namebrand 720k disks pre-used, no guarantee $ 1
but should work fine

FLOPPY DISKS quantity 20 DSDD noname 720k disks pre-used, no guarantee $ 1
but should work fine

FLOPPY DISKS quantity 7 DSHD noname 1.44M disks pre-used, no guarantee $ 1
but should work fine

JAGUAR/STUG T-SHIRTS (ONLY 1 LEFT!!) gorgeous black XLG Fruit-of-the-Loom $ 7
T-shirts with our Atari club's logo on the front and on the back "Jaguar" in
huge red lettering (like on the Jag box) with eerie yellow eyes above it and
"64-bit interactive multimedia system" written below, Brand new never worn
leftovers from a show we attended

JOYSTICK Epyx 500XJ joystick - minorly broken, probably fixable or usable $ 1
for parts

JOYSTICK Epyx hand conformed joystick $ 3

JOYSTICK sold as set: 2 Wico hand-formed joysticks, 1 in perfect $ 1
condition, 1 sticks a little

MAGAZINES great deal! 53 USA Atari mags, 1 Atari disk all together in one $ 3
super cheap set! email for titles, shipping not included

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem $ 3
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume $ 3
control, great starter modem for older computers, incl phone cable, serial
cable add $5

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem $ 3
for older computers, incl phone cable, serial cable add $5

MODEM EXTERNAL 2400 baud GVC, AC adapter, great starter modem for older $ 10
computers, incl phone cable, serial cable add $5

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't stay pushed in unless you hold it; fix or replace with a switch from Radio Shack; otherwise works perfect with great picture $ 13

MONITOR color Atari various models working $ 27

MONITOR mono Atari 1991 model small, grey made by Quadrant, flakey, picture won't sync (wobbly,distorted), maybe fixable $ 19

MONITOR mono Atari various models dead $ 9

MONITOR mono Atari various models working $ 24

MOUSE original Atari mouse guaranteed working $ 9

POWER SUPPLY external for 520 ST's $ 13

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best with larger dot matrix printers, sturdy smokey-clear plastic $ 1

PRINTER SWITCHBOX 25-pin for modems or printers, broken or miswired: does strange things $ 4

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI cables $476

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with ROMS (disk/docs/cable) $ 16

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your clock automatically every time you boot. Incl box, software and hardware. Suggested retail was $57.95. Brand new. No guarentee on lithium battery (estimated 10 year lifespan) $ 10

SW BALANCE Of Power strategy game; manual needed (disk) $ 1

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 2

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 1

SW CRACK'ED game published by Atari (disk) $ 1

SW CYBER Studio Set - hundreds of dollars of great CAD/paint/render software! cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02, cad-3d, plotter & drivers, human design disk, cartoon design disk, cyber control (disk) $ 13

SW DAC Easy Accounting software 2disk (disk) $ 1

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 1

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below (disk/docs) $ 19

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms and pathology recognition (disk) $ 1

SW EZCALC good spreadsheet (disk/docs) $ 1

SW FSM GDOS 5 disks (disk) $ 1

SW GDOS original Atari version 2 disks (disk) $ 1

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as $ 1
an ACC or PRG, works with all word processors (disk/docs)

SW IMAGE CAT complete graphics cataloging system for all Atari ST $ 1
computers (disk/docs)

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black $ 1
plastic videotape style box with the company logo all over; slides into a
white Interlink box

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun $ 2
w/pixelated nudity by Sierra (disk/docs/box)

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 1

SW LIVRE Du Graphisme (disk) $ 1

SW M1 TANK PLATOON still the best tank sim out there, all original $ 3
manuals (heavy Microprose kind:) and box included, includes PC/DOS version too
(will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working
backup) (disk/docs)

SW MACRO Mouse by Antic, record mouse actions (disk) $ 1

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, $ 1
manual for Mergeit only (disk)

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable $ 1
(disk)

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need $ 1
a manual for copy protection (disk)

SW OMEGA strategy game by Origi (disk) $ 1

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual $ 1
for copy protection (disk)

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 1
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 1

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW STALKER 2 older version probably upgradable (disk/docs) $ 1

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 12

SW STENO 1 older version probably upgradable (disk/docs) $ 1

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 3

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 1
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 1
great car racing game with 2 bonus packs of cars! 4 disks, probably needs
manual for copy protection (disk)

SW TEST DRIVE by accolade (disk/docs) $ 2

SW UIS Universal item selector v1.0 the best file selector replacement $ 1
(disk)

SW UMS Universal Military Sim, looks great especially in mono $ 2
(disk/docs/box)

SW UVK Ultimate Virus Killer (disk) $ 3

SW WARP9 speed up the graphics on all TOS machines lots! (disk/docs) $ 6

SW WORD For Word crossword puzzle creator (disk/docs) $ 1

SW WORDFLAIR v 1.1 the integrated document processor (disk/docs) $ 4

SW WORDWRITER ST a fast easy to use word processing system from Timeworks $ 2
that can interface with their Spreadsheet & DB (disk/docs/box)

SW WORDWRITER ST by Timeworks great graphical wordprocessor (disk) $ 1

SW Z-RAM Diagnostics v1.1 for use with Z-Ram RAM upgrades (disk) $ 1

SYQUEST 44MB removeable hard drive w/1 cartridge in 2-bay (1 bay free) $ 50
"shoe box" style external case incl host adapter so you can hook this drive
directly up to any ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive. Incl DMA cable
and software. Everything you need to get going!

SYQUEST CART 44MB each in quantity of 3, no bad secs $ 9

SYQUEST CART 44MB no bad secs $ 19

GOLF VIDEO VHS Improve Your Golf Game w/Richard Zokol, new shrinkwrapped $ 1

DAISYWHEEL PRINTER DaisyWriter 1500/2000 wide carriage, includes good $ 12
ribbon, has weird interface connector, seems to work but sold as-is

FLOPPY DRIVE 5.25" probably dead $ 1

FLOPPY DRIVE 5.25" tested, working $ 2

MODEM EXTERNAL USRobotics Sportster 14.4 w/AC adapter, includes manual; $ 27
serial cable $4 extra

PRINTER CABLE 24' standard DB25M to Centronics $ 5

PRINTER CABLE 9' standard DB25M to Centronics $ 3

PRINTER Epson FX-286e wide carriage dot matrix, working, includes ribbon $ 50

PRINTER Epson FX-85 dot matrix, working, includes ribbon $ 50

PRINTER Epson MX100III wide carriage dot matrix, includes ribbon, 1 side $ 50
of tractor feed is loose/missing spring

PRINTER Nissho NP-2410 wide carriage dot matrix, working, includes ribbon $ 50

PRINTER Panasonic KX-P1091 dot matrix, includes ribbon $ 29

PRINTER Raven PR-9101 dot matrix, includes ribbon, w/manual, missing top $ 35
plastic cover

PRINTER SWITCHBOX CABLE or serial, 6' Belkin standard DB25M to DB25M $ 4

PRINTER SWITCHBOX CABLE or serial, 8' standard DB25M to DB25M $ 3

PRINTER SWITCHBOX auto & manual switch for 2 computers to 1 printer, $ 12
brand new in box, cables extra, MicroMice model AS-201

PRINTER SWITCHBOX manual A-B switch, cables extra $ 10

PRINTER Star NX-1000II dot matrix, includes ribbon, plastic cover a bit $ 29
broken

SIMM RAM 1MB 30pin, quantity 4 sold together (more qty available) $ 3

SIMM RAM 4MB 30pin, quantity 4 sold together $ 44

Outside does not run on the Hades, but only on machines with a 68030
processor, i.e. TT, Falcon and ST with PAK/3.

4504. Re: Cubase >> Roland sysex question

Newsgroup: comp.sys.atari.st
Date: 2001-10-29 08:41:56 UTC
From: Matthew and Caroline Simpson-Morgan <mellotronic@hotmail.com>
Message-ID: <3BDD1652.1E56B8B6@hotmail.com>
Source record: 40918

Thanks KapMaN - I do have a checksum calculator program (PC, not atari) and have used checksums before, but have never worked out what checksum should be used in a string which contains a "variable" number (ie, in Cubase - to switch up and down through a series of values on the MIDI mixer). A variable number is designated on the Cubase mixer as "xx", but I don't know what kind of checksum can cover a varying amount in a sysex string, since that variable will of course change the sum of the string when it varies. Hope that makes some sense.

Hello,

There really is no setup. All you need is to get or make the cable that
goes from the Link II to the SCSI devices. A friend of mine made me
mine. Once you have that, all you do is hook up the SCSI devices and
install your driver software. I originally used ICD software to run my
STe's hard drive, but now I use HDDriver. I have always used Extendos
or CD Rom drives. I am use TOS 1.6 on the STe.

I could not agree more. I would like to find out why the Porthos PDF
manual comes out in black/white under Magic and color under Mint.

Yes, I have gotten Porthos to work fine under Mint/N.AES. Some things
work better under Magic and some thing don't. I really do not care. I
just want the program to develope to it's fullest potential.

Actually, I have done that using two devices. One is the Video Key that
allows any ST to be connected to a TV. It also has some RCA jacks for
video and audio. You also have to have a video converter. This connects
to the VGA monitor and also has some RCA video/audio jacks. Connect the
two together between your ST and VGA monitor and viola.

Thanks Ed, my monitor doesn't have rca inputs :(

I will have to build a custom cable to go from the ST to the vga monitor but
that eliminates using the low & med resolutions :(

>that eliminates using the low & med resolutions :(

I had an old VGA that didn't work like that as I have a feeling it couldn't handle the sync in hi res (hsync 35.7KHz). The same adaptor did however work on a few other monitors. Also, the output isn't as good as the Atari monitors as you get this strange moire (?) effect. It does depend on your monitor however so you may get better results. Trying to display lo+med rez on VGA is difficult. I think it requires a video buffer which has the data from the ST put into it and then it is read out at double the speed. You can speed the ST up 2 times to get the same effect but requires quite a lot of work. Then again, you could just plug it into a TV :)

In the "The Atari Compendium" you have a lot of information about the
plataform.

http://www.fortunecity.com/skyscraper/apple/308/html/toc.htm

Also i recommend you the ICTARI diskzine, have a lot of articles,
sources and tutorials for various coding languages. You can get issues
in some Atari FTP servers.

Not here it doesn't. I don't know why you're having problems. I'm using
PhotoTip 3.00 and 3.01 (the latter is beta test), Magic 6.01, Freedom or
Boxkite.

>returned to PhotoTip, i.e. F:\IMAGES*.*\ so maybe that's what's
>confusing it. I also assumed File/Open would open an image, but

The file path in PhotoTip for a slideshow just indicates the folder name viz
"L:\Photographs\"

File/Open does indeed display a picture as you'd expect. Since you've used a
3rd-party prog to create your test jpgs, then suggest you use a gif from
another source. It does sound like you have other problems however...

> controlled by MIDI as well.

Yeah, that Electronic Cow program seems to be exactly what I had in mind. I wasn't aware though, that the ST had no filters. But you know what, there are a gazillion VCF schematics on the internet that I could add to the ST.

Hey! I could build a modular system with the ST emulating the VCOs and the ADSR envelope generator for the oscilators. It would be cheaper and easier than building midi controlled VCOs (especially since a 1040ST can be easily found in thrift store for around $10). If I tap the oscilators directly off the chip like you suggested then I could even route each oscilator to it's own VCF.

It seems too that the Yamaha chip in the STs only produces square and white noise waveforms, but I seem to recall seeing the schematics for a Square>Saw waveform converter on the internet.

Hmmm... an Atari ST based modular synth. I'm actually pretty excited by this idea. I've always wanted to build a modular synth. Unfortunately I've always lacked the time/motivation to do this. But this Electronic Cow sound chip synth software could really give me a leg up on this. Of course I'm still left with the problem of triggering the envelope generators for the VCFs. I could have used one of the oscilators to trigger a gate but that won't work if the oscilator has a slow attack. Oh well... I'll tackle that problem later. Maybe the software can be modified to use a joystick port as a gate for triggering external modules.

Has anyone here ever pulled audio off the Yamaha chip? Is it any cleaner than the audio on the DIN plug?

Crackers

IMHO the biggest limitation is that there are no scroll bars on the
document window. Using the "Fit Height" icon produces an image that
is hard to read, even on a 17" monitor. Could this be a MiNT/NAES
limitation or part of the demo "crippling"?
Otherwise, it seems to work OK on my Milan040 (48MB) with
MiNT 1.15.12, NAES 2.0 and NVDI 5. No WDIALOG or printing problems,
but I did get a Runtime Error 20-something when I tried clicking
the "?" icon when it wasn't grayed out. Needed to do a <ctrl>-C
to unlock things after that. One big advantage over GEMGS, other
than speed, is that I don't need to switch back to 256-color mode
to get a display!

4521. Re: Has anyone ever made a "mini ST"?

Newsgroup: comp.sys.atari.st
Date: 2001-10-29 18:38:34 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <plhD7.302$HN2.18905216@news.incc.net>
Source record: 40932

All they were/are doing is "stretching the unpaved road" a mile or two farther. Atari machines (original and clones) are simply not up to snuff and the "elder product line" (060/ColdFire, etc.) just aren't going to cut it, because you have to make too many compromises software/hardware-wise.

Because Atari is dead, the "spirit" of Atari is fading. Atarians are running on fumes, pure and simple. Nothing more. What I suggest is to take the software we love on the Atari ST and "transition" it to new hardware. Having a built-in ST emulator will make it simpler.

And, after looking around, I'm thinking that a hardware "Mini ST" is the only real secure bet we've got for this project. I'm not sure how many PowerPC-based Atari ST emulators are available, but STonX, running in LinuxPPC, seemed like a safe bet... that was, until I saw that it needed X-windows to run. *sigh*

However, the more I think about it, I come back to the question of "Why?". Is it really going to be successful? Will Atarians be willing to keep just the software portion of thier past and use ot on new hardware? What makes that any different that porting it straight across with no emulaor in the new system?

What brought me to this resurgance of my "Atari revival" plan was that I found a motherboard (out of an old Tandy 1000HX (XT-class) computer and noticed that, as far as I can tell, it's purely double sided! Not multi-layered like most, more modern motherboards. I looked at the components and thought to myself...

"The Atari 1040ST could easily be done on this board!"

If you use a CPLD and use it to "emulate" (or even "translate") a bunch of the 1040ST's custom hardware to a PowerPC system's keyboard, mouse, video and audio, etc., you could probably make a "Mini ST" VERY small indeed!

However, the end-result is what we need to look at. Are we willing to run/port our favorite ST applications on non-Atari hardware, in a non-Atari OS, for the pure sake of using those apps? Do we love the apps THAT much? Do we love the nostalgia of the software THAT much? Or is it more to do with the hardware than the software?

Once we answer these questions, we'll all know if continuing anything to do with "Atari" is even worth it without the name and the OS itself. Frankly, I don't think it is, but I always hope some people will give me the sign that it could be...

I have never claimed that a software-based emulator could run *all* old
and new software. What I've said is that such an emulator would be more
compatible with old software than even a Falcon. And this is definitely
true.

> has only been one really good example of one system emulating another, ahnd that is
> the PPC & G3/G4 macintosh systems emulating the earlier 68k macs. Try to run 68k

Ahhh, you're starting to get the point! You see, this emulator was nothing
but a CPU-emulator, it didn't try to emulate a complete machine. This is
why this emulator works as well as it does. Try reading Peter's and mine
posts in this thread and see if you understand what we're saying this
time.

> based Atari stuff on an x86 system running windows is still an outright absurdity
> and a waste of time. And its not the intent of the proposed project which is to

Absolutely not. Such a project would result in the cheapest and fastest
clone possible. And it's realistic due to low costs.

> build a modern and compact ST, not just another windows whitebox running a second
> rate emulator.

"Modern and compact ST" == expensive and underpowered piece of equipment
that will be very hard to get. I just bought a Milan, so I know...

And why do you think the emulator will be second rate? Why can't the
emulator be fast, efficient and stable/compatible? Can you explain this to
me?

I use my Atari TT for the applications. I like my operating system
(MiNT+NAES), I like the gnu compilers, I like the DTP programs like
Calamus, I like the wordprocessors. But I like the operating system
the most. I couldn't give a crap what computer they ran on.

I got my TT about three years ago and already I've purchased hundreds
of dollars of software (from actual Atari dealers, not just eBay), a
Galaxy graphics card, and an aixTT memory card, all new from dealers.
So the hell with Atari not getting any new users. I'm a new one!

If I didn't like to use the TT and its applications, it would be
sitting in the closet just like my 8-bit Atari's and the Amiga. I am
partial to the Atari name, but that's not why I use one. Hell, I'd
love to own a clone like a Hades or, by some miracle it gets built, a
Pegasus!

What if it were a PC running Windows 98 manufactured by Infogrames
with an Atari badge glued to the case? Wow, I guess I'd have to buy
one! (sarcasm)

There was a company called Atari who manufactured computers, but it
wasn't profitable, so they stopped manufacturing computers.

> have 80% chance they are line level.

They are pretty much line level, but be carefull with one thing.
If you ever want to use sampled sound again from the ST, make sure you
build in a switch to combine the three channels into 1 again.
Digital sound on the ST is done by adding different levels of sound from
the 3 sound channels, to combine this into 1 digital channel.
Multiple digital channels are made by adding the channels in the digital
domain, and then outputting to one (improvised) DA.

For some pure ST sound composers, check out http://www.brainbug.ch/stsound/tools.html

About halfway you will find some nice tools, though if i recall
correctly, none with midi support. I'll see if i can dig up some sources
of Chipcomposer, though these were done by Eagle.
I think that for your purposes Chipmon 2 or SidSound designer are best
suited as far as sound quality goes. (I dont think the XLR8 chipcomposer with
full SID sound was ever released.)

good luck

architectures appears to be quite limited.

> And my statements are in fact not ignorant or arrogant in the least. I deal in hard
> FACT not fantasies, What Peter and yourself claim about performance of emulators is
> nothing but fantasy.

There's no question that a reasonable efficient 68030-emulator on any
current x86 will outperform a 66MHz 060 (the fastest 68k around) easily.
With a really *good* emulator I'd say such an emulator would be perhaps 10
times faster on a low-end 1Ghz x86. That's around 50 times faster than my
Milan, which essentially is an old PC. So, unless you know a secret source
for equally powerful 68k's, there is no alternative to emulators if we
want faster computers than current Hades060 and Milan060.

Now, if you still believe that I'm talking about emulating a complete
machine you might be right. Such an emulator wouldn't be particularly
efficient, although it will still be very fast.

> Put simply it goes to credibility, and mine is quite solid.

It doesn't look that way from over here.

Btw. your quoting is horrible. Please do something about it.

From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <QTjD7.311$MP2.19039363@news.incc.net>
Source record: 40942

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, ha d some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

ehmm.. actually, its worse then that, its just saw, triangle and white
noise (check the specs online for the YM2149). Hmm.. easier to make Square
out of triangle anyway.

: Unless...

: Say what you will, but you must answer me this. WHY do you use an Atari
: computer and the software that you run on it?

-1-

I use my atari because it runs off floppy disks and is therefore totally silent most of the time. This is the single biggest reason I keep it.

It's perfect for dialing in the evening as it's relaxing to use because it's quiet, unlike my PC - and because it's silent it doesn't interfere with music.

-2-

The monitor is nice and sharp and clear, even better than my (now old) MAC, and much better than my previous PC monitor, and so again is more relaxing to use. (Though my latest PC monitor is just as good and much bigger).

-3-

It is a cheap second computer so that I can aford to have one sitting by my music equipment and another (non-atari) upstairs.

-4-

I have some perfectly good programs which I do not use enough to warrant buying, but are useful/interesting enough to want to keep. This is especially true of the midi programs. (Even more so now that various previously commercial programs can be had for free.)

-5-

The midi works well. Plug it in and it works.

-6-

nostalgia - I just kinda like my old atari, and since it works - why not use it? I like the way the ST looks. I like my old atari mouse, it's heavy and tracks well, and doesn't accidently move around.

Sure , sounds cool. wouldn't mind doing something like that but I can't
program except for Basic but I guess it may be OK as its quite easy to
change the Yamaha stuff.

>It seems too that the Yamaha chip in the STs only produces square and white

There may be a PDF or something about the Yamaha chip (YM-2149), I seem to
remember reading something about that. There must have been a datasheet
when it was released , depends if it is still kicking around in space :)

Parallel port? I'll have to research how analog synths work. You have
oscillators controlled by other oscillators and then fed in filters which
can also be controlled by oscilators and these can also have ADSR IIRC.
Been a while since I read about them and I've never used one but that
doesn't mean I wouldn't want to, quite the opposite! I remember playing
for ages on the Commodore 64 on this Game Construction Kit playing with
the sound effect tools. Damn, never should have chucked that disk out.

>Has anyone here ever pulled audio off the Yamaha chip? Is it any cleaner
>than the audio on the DIN plug?

I can tell you this, it gets fed into cheap parts and crappy transistor
which has it's supply on the 12v line. Ahh, I do remember one problem and
I think it is to do with the YM, you get nasty noise when operating
intensive CPU stuff. This may be due to the power for the amplifier not
being isolated from computer. If you stick it through a nice op-amp fed

of a 7808 or something and send to back of ST with 3 RCAs you can then do all work outside of ST for filtering which would give better results IMHO.

You might be interested to check a mates site out - http://www.joogn.de and go to Sidthesizer.

Well there we go then. I suspected that it would be the internal
amplification circuitry that is responsible for the poor S/N ratio as well
as the processor noise.

Huh? OK, so CAB isn't perfect for online ordering and stuff on the web.
I use my 486 for that, but the rest my Falcon has got it covered easily.
DSL? Get an ethernet adaptor or something and hook the Falcon/ST up to
your PC and actually *use* it. My Falcon does rest fine, IRC, ICQ, news ,
mail, FTP. And all those programs I use are actually better to use than
the PC equvilant and a hell of a lot faster. I can read mail in seconds,
ICQ doesn't grind my Falcon to a halt etc.

>PDA's, laptops, and more again... that you wouldn't be thrilled?

Having been an ST user for maybe 8 years, I can't say "nostalgia" is my
motive. More, it is an appreciation for UNIQUENESS. I would certainly
be thrilled (to the point of purchase) if an "Atari" were to start manufacturing
computers - but not if they were just more Wintels. The old Atari tried
that, too, and failed with the rest of the wanabee clonemakers. If I wanted
a boring Intel peecee, there is no end of cheap ones around, and I surely
am not going to pay for "brand name" appeal.

Now, an Atari system (TOS/MiNT/etc.) that ran on an Intel without the
presence of M$ would be UNIQUE enough to attract my interest... even
if you needed a 68K emulator to run the old binaries. And gets you out
of the trap of designing/building hardware or wrestling with Infogames
for a license to the name. Better yet, make it (to quote Be) "platform
agnostic" so it will run on Intel or old PowerPC Macs, which can be gotten
cheaply indeed.

I've no idea... all I can tell you is that it makes a difference, from a
user viewpoint that's all what matters. Why it works is not my concern.
You're the programmer, not me... :-)

Hi Chris,

>I've downloaded PhotoTip, I can have a play round with it over the weekend.
>I've seen the list of supported cameras, however it seems to have been last
>updated in June 2000 and the list bears no relation to the cameras
>available in High St. stores today. Put it this way, none of the cameras
>that I'm able to buy appear on the list!

PhotoTip is a shareware project and the programmer doesn't have the resources
to test it with every available camera. He relies heavily on the input of the
users. In general it's save to assume that models from a certain brand will
work succesfully i.e the Olympus C2040 and Nikon Coolpix 880 which both are
not on the list work just fine.

But I know what you mean, you can't just go and buy a "bargain" in the High
street anymore. Unfortunately this doesn't only apply to digital cameras,
it's getting increasingly more difficult to find hardware that functions on
our Atari. Just try to go and buy an (affordable) scanner that works with the
current available scannerdrivers. Even a SCSI CD-R drive is hard to find these
days. Unless we're willing to buy second hand or old stock stuff we'll soon be
faced with the dilemma that there are simply no more scanners, cameras, cd-r
and cdwriters not to mention printers which we can connect. The manufacturers
seem to have dropped SCSI, Serial and Centronics ports in favour for USB and
Firewire...

Sorry for that last bit, I know it's completely off topic. But unless this
problem is tackled quickly we'll have no need in the near future for threads
like these since there will simply be nothing available anymore that can be
connected to our machines. There are several convertors for sale at the moment
but these are useless without proper custom written drivers.
Come to think of it: the latest batch of digital cameras nearly all dropped
the serial interface in favour of USB ports, so it's not off topic...

Cheers from Belgium
Dennis

Date: 28 Oct 2001 11:08:07 GMT

Hi Chris,

>Apparently because ST Guide is a dead format and no-one uses it any
>more!

I disagree, nine out of ten new releases use ST-GUIDE, and increasingly more programmers use is as online help system. The ST-GUIDE hyp files established themselves as one of the few general accepted standards on this platform. it's flexible, quite easy to set up, doesn't consume large amounts of memory, is very fast and can be used on anything that is TOS compatible.

>Also, I think they wanted to show off the hyper-linking
>features of the Papyrus format, and include images and screenshots.

All they've showed is that their hyper-linking features are not only a messy but also a buggy lot, and that's putting it very politely...
Papyrus is written for the PC and the Atari code is ported over, BTW: I'm not claiming this, Ulli Ramps did.
Since there is no ST-GUIDE help system on the PC and ROM obviously couldn't be bothered to compile a decent hyp file they've opted to simply include the PAP documents and introduce us to a help system a la PC, some sections in the docs are even devoted to the PC-version. ROM didn't even show common sense to delete these.
BTW: that last alinea isn't claimed by Ulli Ramps, but is my conclusion ;-)

Up until version 7.51 the Atari versions of Papyrus came bundled with a nice and *very* good German hyp file, for people here who understand German this might be a solution, since version 8.0 hardly has any new features compared to 7.51 the hyp file is still up to date.
If anyone here want a copy of that hyp file, just mail me...

Cheers from Belgium

When I had only a twin floppy system it was very usefull. Because the
MicroEmacs is memory resident
its very quick to load files, and it also has a facility that allows you to
compile from with UE.

So when used with the somewhat buggy SOZOBON "C" compiler it allowed you to
do "C" development on a
dual floppy system. I wrote my first Voice Manager for my Yamaha Organ using
such a system. Mind
you development speed increased about 10 fold when I got my first hard
drive...

> of Chipcomposer, though these were done by Eagle.
> I think that for your purposes Chipmon 2 or SidSound designer are best
> suited as far as sound quality goes. (I dont think the XLR8 chipcomposer with
> full SID sound was ever released.)

XLR8 in the released form does have one SID-voice, although the replayer
in the saved modules do not play the SID voice.

Sid Sound Designer, Chipmon 2, XLR8, Megatizer 2.93 are the ones with
sidvoice which can be downloaded. Then there are a few more which are not
available (yet) for public.

And typically the ones not available are the ones with the best sound
possibilities. It's the editors by Tao (Magic Synth) and Mad Max (mmtfmx).
They are doing quite interesting stuff with hardware envelope resetting on
interupt, small looped volumetables ("sine") and also modulated
volumetables. They are also doing "sid accords" meaning they fake an
accord on one channel with frequency change in the sid interupt as well.
And much more, Tao is still finding new techniques..

Hi Jo Even,

>IIRC WDialog started out as an extension to MagiC, which later on was
>implemented in MagiC itself. Am I completely wrong here?

No, you don't remember it correctly ;-)
Although you should, since this discussion pops up here on a very regular base ...
WDialog is a TOS system extension and has nothing to do with MagiC. MagiC needs Wdialog just as much as TOS. Newer versions of MagiC are supplied with an SLB wich replaces Wdialog, but the simple fact remains that to use certain functions of a program that uses routines from this extension, Wdialog or the SLB needs to be present in memory.
Wdialog offers exactly the same functionality under MagiC as it offers under TOS, therefore Wdialog is a TOS system extension and not a MagiC extension.

On a blue monday someone introduced the very silly story that Wdialog was written for MagiC and the MiNT-community embraced it like crazy, Wdialog is written for TOS and compatible OS. AFAIK MiNT is not an OS (technically speaking) but also a TOS system extension. Perhaps that's the reason why they conflict?
I know it's starting to get boring but once again I've got to refer to the manual. The brother Behne don't claim that Wdialog will work under MiNT, MiNT isn't even mentioned in the users and programmers docs. Wdialog was developed back in 1995. MiNT wasn't what it is now back then, it wouldn't surprise me that the brothers B. didn't even know it existed.
In that period one could still buy a Falcon supplied with MultiTOS, a lot of programmers didn't bother about MultiTOS back in 1995. Except for Atari who supported it who else did?

Why is it that no one ever blames N.AES for not being 100% compatible with Wdialog? When N.AES 2.0 was developed, Wdialog was already widely used and established itself as some sort of standard.
BTW: is xAAES also incompatible with Wdialog?

To end with a constructive note ;-)
Has anyone tried the Wdialog replacement PDLG.SLB under MiNT instead of Wdialog? Since MiNT can now load MagiC-type SLB's this might be more succesfull then trying to load Wdialog or Ndialog for that matter...

Cheers from Belgium

Hi Dieter,

>Ever thought in the other direction?
>Maybe some people in here benefit from his offers, maybe they find XL/XE or ST
>stuff they couldn't find anywhere else or for much higher prices on ebay!?

Ofcourse there are people here that benefit from his offers, but finding his website or stuff he's offering isn't very difficult at all. I haven't seen one search engine yet which fails doing this, a potential customer can be informed whenever Bravo Sierra has new bargains by subscribing to their mailinglist. And the argument that the Sierra Bravo prices are reasonable is not a very strong one considering that only a very small portion of the weekly two postings are devoted to products and pricing.

>So let him post here.

You do realise that this means opening the Pandora box?
You can't allow one dealer to spam here and flame another one for doing exactly the same thing. From a dealers viewpoint a newsgroup is an ideal target, there's no better way to reach potential customers. He can reach us without any efforts and compared to the traditional methods it's even free. Luckily most of the dealers have the common sense and decency not to spam here, can you imagine the traffic here if all the dealers and so called dealers started spamming here on a regular base?
Do you really want a filter list that's a mile long? :-/

There are many Atari webpages that have links to dealers, and if a dealer has something to sell that really is rare or interesting he can always report it to forums like ATOS, MyAtari, MagiCOnline etc. If it really is interesting I'm sure they will announce it and even devote an article about it. If Sierra Bravo would follow that route instead of treating us to the weekly two spam postings here, there wouldn't be any reason for Steve to get upset in the first place. For what it's worth I fully agree with Steve. Sierra Bravo has been spamming here for years now, if there's one certainty in life, it's those two postings appearing here every week like clockwork. Following yours and other posters in this thread their reasoning we soon will be treated to an avalanche of spam..
IMO instead of defending this behaviour we should all stand up against it.

I noticed that your emailadress contains a spam blocker, so you object to spam in your mailbox, but it's OK in your favourite newsgroup? that's a very weird attitude if you ask me :-/

Cheers from Belgium

4550. File handling problems...

Newsgroup: comp.sys.atari.st
Date: 2001-10-30 14:25:25 UTC
From: parris_k@yahoo.com
Message-ID: <aa5c37da.0110300625.2facf536@posting.google.com>
Source record: 40964

Hello there.

I have two ST which I use in a studio setup, one as a sequencer and one as a sampler. Problem is, I only have one hard drive, attached to the sequencer ST. MOst of the samples are stored on the HD and I am sick of transferring them via floppy.

I had a quick go at writing a file transfer utility to squirt the files down the MIDI interface instead (and store them in a RAM disk on the HD-less ST)

The basic algorithm I am using is:

```
fopen(FP,file_to_copy, 'r')

while (!feof(fp))
{
Bconout(MIDI_PORT,fgetc(fp),
}
```

I realised there was some work to be done on ensuring that all charaters were being sent (as I was ending up with some garbled files) so I changed it so that it merely copied from one file to another on the same machine in order to do some debugging. Now it looks more like this:

```
int Buffer[FILE_SIZE];
int *buf_p =Buffer;

while (!feof(fp))
{
*buf_p = fgetc(fp);
buf_p++;
}
```

then another loop to empty Buffer into another file.

I started to notice some strange behaviour...

1) A simple ascii text file is no problem, .c files can be opened, read into the buffer and written back with no harm coming to them.

2) .AVR files (the file format for the samples I use) seem to get terribly corrupted (i.e. they no longer sound like recognisable samples when they reach the sample player)

3) Trying to copy an executable byte by byte does not work. The new executable will not run. It also appears to have grown in size in

comparison to the original.

3) The program appears to read less bytes than the file size! i.e, a file might claim to be 50k when you look at it through the GEM interface, but when the program only appears to read 40 something K before hitting EOF.

Does anyone have any ideas where I'm going wrong? Does GEM/TOS maintain some information about the file in addition to the raw data that comprises the file?

Any and all help gratefully received. If you feel the need to install some shaky, hacked up transfer program of limited use, you are welcome to a copy (if I get it working..)

4553. Papyrus Office 9

Newsgroup: comp.sys.atari.st
Date: 2001-10-30 17:04:06 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3BDEDD86.D576EC64@patent.gov.uk>
Source record: 40967

Hi all,

Now that ROM are releasing the German version of Papyrus Office 9, and the English version, 'in a few weeks', I wonder if anyone has asked them about developing a version for the Mac, as now that it's OS seems to have settled down with a stable version of OS X, it seems an opportune time to do so. I run an earlier version under MagicMac on my B/W G3, but it would be so nice to have a Mac version and there is just nothing nearly as good as Papyrus on any non-Atari platform. The supremecy of Atari programs is also seen in my beloved DA's Layout, which now seems to have disapeared :((. I have ordered a copy of PageStream 4, so at least the Atari will live on in part.

As for the PC vers Mac vers Atari, thingy; my musician son does his home studio work on a C-Lab X Falcon with Cubase Audio; high end mixing, recording etc at a proffessional studio, on a PC using VST and uses my Mac G3 for all his e-mailing. He says that the Falcon is rock steady, never crashes (he takes it with him where ever he goes), the PC is fast and flashy but crashes all the time, and the G3 is so much like a super fast, Falcon that he finds the transition almost seamless. He has his eyes on my Milan, but he can buy his own!!!!!!!

As for the 'Atari loyalty' and what is an Atari? thingy, my personal belief is that all you can say is that you like or dislike a particular look and feel about the GUI. Jinnee on my Falcon looks and plays just like on my Milan and my Mac under MagicMac. Within certain limitations the three totally different hardware systems, when caused to operate according to the respective OS and overlays are indistinguishable, excepting for their speed and graphical capabilities. The origonal GEM GUI on the ST, set the standard for the look and feel, we have come to identify with 'Atari', but that's all it is, a 'look and feel', not a particular manufacturer or religion.

The Model T Ford had four wheels, an engine and a stearing wheel, and because that formula proved eminently practical, we find that the latest super car also has four wheels, an engine and a stearing wheel. The Ford, although only still driven by die-hard enthusiasts, is also respected by all motorists as being the father of modern, fast cheap, mass-manufacture motoring. Why can't the origonal Ataris be given the same respectful rest.

Bob King

Hi Tom,

I suspect that the program your using the high bit from each byte as its sent across, I suspect this is why text (7bits of each byte are used) come through ok and the binaries dont. you could try using either a terminal program and a null modem cable or use some of the software designed to transfer data via the midi ports such as littlenet.

I tried putting in PDLG.SLB once, but nothing happened.
Still got a message something like "WDIALOG not installed".
I'm guessing it needs to be activated by some OS call, which
MiNT doesn't do by itself. If this is true, does someone have
a "driver" for it?

Since some days, I look this thread, this is my point of view.
You need a processor who have more registers than the processor to
emulate for a fast emulation, the better choice is a PPC. I have a good
test for CPU speed... MP3 decoding (lot of muls with integers).

For example with DSP, under FALCON/CT2B 50 MHz (12 Mips) I obtain an
average CPU load of 580%, with the same file under an iMac 500MHz
(MagiCMac) I obtain 27%. Bogomips test said 233 mips, it's true
580% / 27% <=> 233 Mips / 12 Mips. It's 20 times faster with a 10X
frequency and the macOS 68020 emulation !

An x86 is a poor solution because it's the 8 bits generation like the
6809, there are just some registers and GHz. In this conditions the
emulator uses lot of stack, and the 2nd problem is the little endian
format.

For me the are only 2 ways, overclocking of 68060 or a PPC emulation,
I prefer the 1st solution like the CT60 project :-)

Regards,

Didier.

I'am sorry it's a BIG error, the 580% it's _without_ DSP, _with_ DSP
I obtain 15% of CPU load (better than the iMac ;-))

I know, I know! But that's what ROM said when I queried it. Also,
from their point of view, keeping the help files as Papyrus format
means that they don't have to convert the help files to individual
platforms. But having said that, Papyrus format is quite unwieldy and
clumsy to be used as help files, it's good for hyperlinking documents
but not for quick reference applications.

Tell that to ROM! I tried to explain to Ulli that ST Guide, although
it's no longer developed, is the most popular help file format.

Source record: 40975

Hey Jo,

Its time this idiocy of yours ended. heres why

Peter, and yourself claimed emulation would be better than a real st in every way (but now your changing your tune!) but offered no real facts back up such statements.

When I confronted You on this matter, you accused me of being both arrogant and ignorant and attacked me and insulted my intelligence. At the same time offering nothing but vague innuendo to back up your statments.

Now your attacking my abilities and qualifications. You even go as far to falsely accuse me of knowing nothing of computer architechture despite the fact that I've already explained that such knowledge was gained through my post secondary education and is part of my work on a regular basis.

On top of all this you've done NOTHING to contribute to this discussion. Quite the opposite. You've hicjacked this discussion and have exhibited behaviour typical of a wintroll.

Lets face some facts here. You are a wintroll, by your own statements you've shown your preference for x86 systems and your disdain for any new atari compatible hardware. Instead of wasting our time on here with your bogus statements you should start educating youself on the subject on which you've been shooting off your mouth.

Heres a short reading list for you:

"The 80x86 Ibm PC & compatible computers, volumes I & II"
Muhammad Ali Mazidi & Janice Gillispie Mazidi
Prentice Hall Englewood cliffs, N.J. 07632
isbm 0-13-321399-4

M68000 Family Reference
Document FR68K/D (a newer edition of this is out)
Motorola

MC68030 Enhanced 32-bit microprossor User's Manual
Motorola

This is a short list you started.

Frankly I'd be surprised if you read a single word of any of them. You seem content to wallow in ignorance and then lash out at anyone who points out your glaring errors. Just remember that sort of thing isn;'t tolerated very long in the real world, nor is it tolerated in here. Go ask sinclap, he's found out the hard way.

Then you'd better open your eyes and close your mouth in a big hurry Jo. As I said, I deal in solid facts. Yes Jo, I said FACT, something that can be proven or disproven. You would be doing yourself a favour and attempt the same. My statements stand quite well, that is why my credibility stands where as you don't have any at all. That is why I tell you either start making positive contributions here and quit spewing blatant BS or get lost.

>
> Btw. your quoting is horrible. Please do something about it.

I snipped anything not from the message I'm replying to, this is nothing horrible about this. On the contrary its something known as editing, which is important as you'd know if you'd ever had any business writing courses.

Absolutely, I refer to a previous thread of mine recently about Zip drives and whether it's possible to get an adaptor to convert a USB device to SCSI. I rang a well-known manufacturer (so well known I can't remember the name now - Belcom?) about adaptors, as they do a SCSI to USB one, and was told by one of their sales staff that there is no USB to SCSI one available and that it's impossible to connect computer peripherals to a game console! They're obviously not aware of what SCSI is and that there is life outside the PC world...

Jared Falvo <luposian@azob.quik.com> skrev:
: Unless...

: We regain the Atari brandname. Otherwise, we'd just be porting Atari apps
: to run under a different processor/OS platform. That doesn't make them
: Atari apps any more. It makes them X-app running on X-hardware. It's no
: different than porting any game from the arcade to the Playstation, or
: WordPerfect from DOS to the Atair ST. The reason those apps were considered
: Atari ST applications was because they were *unique* to the Atari ST! And,
: if they weren't, they were usually only ported to or from the Amiga
: platform.

: If the effort to "revive Atari" is to have ANY hope, we must go to the
: source (Infogrames) and reaquire (by license) the Atari name with reference
: to a computer/hardware division.

Jared,
you are a sad git! A sad, sad git! When will you leave Atari users alone?

: However, we must be resolved to do this. We must see that anything less is
: utterly a waste of time and pointless. Emulation, for the sake of enjoying
: the "old ways" just one more time is simply a time-wasting "nostalgia trip".
: If we are so desirous to get back to the days of Atari's golden age, we
: must realize that it involves the NAME! An Atari computer is NOT an Atari
: computer unless it is called an *Atari* computer. And, none of the clones,
: regardless of their ability to run Atari ST/TT/Falcon030 applications are
: Atari computers.

Just like an IBM clone isn't an IBM PC. So what? Only a fraction of PC
users run IBM machines!

: An Atari computer isn't an Atari computer unless it's *called* an ATARI
: computer!

You're living in 1986, Falvo. Shut up and leave us alone.

: Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that,
: if "Atari" were to make a comeback, and started manufacturing computers,
: PDA's, laptops, and more again... that you wouldn't be thrilled?

You're the one being driven by nostalgia, Falvo! You're the one who's
ranting on and on and on and on and on about stupid superficial features
like the name, the logo or the case!
And you have absolutely no touch with reality! If you had, you'd leave us
alone and shut the bloody hell up!

: If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is
: an issue of pride and trust. Sure, that trust has been marred by the people
: who owned it before and the name "Atari" is merely being leeched for some
: game titles by Infogrames. "Atari" hardly means anything but "dead, ancient
: game company", these days, but when it was first created, it meant
: "Success!" (I believe that's the correct translation, if memory serves me
: right).

How dare you, who are not an Atari user, who are not interested in the
clones, totally uninterested in any developments which have occured after
the STFM, come and lecture us about what being an "Atarian" entails?
How bloody dare you?

: Because nothing, but NOTHING... is the same as owning an Atari 1040ST back
: in 1986, right after my graduation at Pasadena High School. Do you even
: realize how excited I was when I saw the first 520ST ad in a magazine? Do
: you know what my reaction was when I saw my first 1040ST ad?

You're a sad, nostalgic git. Go read your old mags. Ignore thrity-two bit
processors and colour graphics. Ignore multitasking and hard drives. And
while you're at it, leave us alone, and stop insulting the remaining Atari
users.

I've tried File/Open with one of the small 'viewable with any browser'
GIFs available everywhere, and it still says "Cannot read a picture
file.". Considering Imagecopy and CAB have no problems with my
images, neither do Netscape, IE, PaintShop Pro etc, I suspect there
is a slight problem with PhotoTip! Try downloading some of the
GIFs from the home page of my web site and view them in PhotoTip -
that will prove if there's something wrong with my images or not! The
images I've been testing with Phototip have all been from my web site.
Phototip is probably not compatible with something I've got running.
I tried disabling FVDI (and re-enabling the NVDI drivers) but with no
success. I'm running WDIALOG - never been sure what that does though.

James, you piss me off.

You don't get it, do you?

We are not having an "Emulating vs. The Real STuff" war here. *You are.* We are discussing one possible sollution for a clonesystem here, not THE possible sollution. Let us do that if we want to. Leave if you don't like it.

What you have contributed with so far is telling everybody exactly how bloody stupid you think they are before you actually have listened to what they have to say. Don't do that if you don't know what you are talking about, because it shows.

I don't feel I have to proove anything here. I have the experience I need for having this discussion, working with both hardware and software development on several architectures. I work in what you call the real world. Obviously you don't.

I cannot exactly say that my answers to you were friendly, but can you blame me? Most posts you write in this newsgroup contain an insult of some sort or another. If you find peoples reactions to that strange you need check your brain.

in this newsgroup.

You pratt!!. you'd better tell people to stop buying Ford Fiesta's and
Vauxhall Nova's coz of the way they are driven by 'Some People'. Dillweed!!.

> There are a number of individuals in this newsgroup who should look at
> themselves in a mirror, and ask themselves if their actions present a
> positive or negative impression of the very few Atari users left.

Could you take the time to explain what a 'rule' is and its purpose please.
Or are you the sort of idiot who turns a blind eye to what suits them.

Source record: 40982

To prove that such an effort CAN be done, just go to:

http://www.beunited.org

These are a group of people trying to save BeOS by *licensing* the source code *from* Palm. Assuming the sale of Be's IP (Intellectual Properties) goes through, we're all hoping they succeed.

All I want to do is license the brandname "Atari" (and access to all computer-related materials, schematics, source code, etc.) for use in re-creating the computer division.

However, aside from the relative "simplicity" of this plan, we need to find out just how many people (current and ex-Atarians) are willing to go with this plan, provided they realize that the name and the products that go with it is what this plan is all about.

Yea or Ney. Yes or No.

There are other aspects of this plan that are pointless to even mention until we know just how many are willing to commit to the plan and put their name and Email address in a list (petition).

The first step is to marshall our forces. Once we can show just how many are going to be involved in different aspects (buyer (i.e. end-user), hardware developer, software developer, OS programmer, etc.) of the plan, we find out what we need to do to aquire the rights (a license) to use the name "Atari" in a computer division. It may require money up front or be part of a "per sale" arrangement (I'm hoping the latter).

I'm sure setting up a site where people can post their name, Email address, geographical location, and "position" (what aspect they want to assist in as part of in the plan), is a good idea.

Like I said, we must be resolved in this effort. That this is the ONLY way. No arguing about how we proceed (suggestions are welcome, however) or getting two or three steps ahead of the step we're in.

Nothing can be accomplished until we aquire the rights (a license) to the name "Atari" and permission to use it to start a computer division. But, in order to do that we must be united in the "how and why" of what we're doing.

If we don't do this right, they'll probably never even consider it. And, even if we do, they may not consider it. But we have to give it our best shot. If we never try, we can't *possibly* succeed.

Afterall, we can't be any worse off than we are now, can we?

Jared

I don't mind occasional ads, I do mind people imposing multi-page ads on me that I have no choice but to pay for. Others can advertise with a simple one sentence with a link in, others should be able to adapt.

Trolling again Dennis? ;-) Please define "operating system", and then tell us why FreeMiNT isn't one.

> speaking) but also a TOS system extension. Perhaps that's the reason why
> they conflict?

No, they conflict because the way Wdialog is designed and implemented means that it has to mess around with other processes' memory, and this is *not* something you want in an OS with memory protection.

Generally speaking, there are three ways to decrease the stability of a multitasking system on our platform:

1. Mess around with memory and resources that are not your own.
2. Hook into traps.
3. Use callbacks between processes (this is really just an even more dangerous version of #1).

Wdialog does both 1 and 2. I don't think 2B does this just to be mean, but these sort of things happens when one tries to get things to work with TOS as well. I've tried to figure out how WDialog works, and I must admit that I quite don't understand how the author of N.Dialog managed to implement the same functionality and still get it working with MP. The design looks rather messy.

> I know it's starting to get boring but once again I've got to refer to the
> manual. The brother Behne don't claim that Wdialog will work under MiNT,

You are ofcourse perfectly aware of this, but WDialog isn't used with N.AES, and hasn't been for a couple of years ago. So this discussion is really pointless.

> Why is it that no one ever blames N.AES for not being 100% compatible with
> Wdialog? When N.AES 2.0 was developed, Wdialog was already widely used and
> established itself as some sort of standard.

Because it doesn't make sense to support WDialog in it's current form. It compromises the design of the AES, which is already far from perfect. That's why N.Dialog exists. It implements the same functionality as WDialog, but without compromising memory protection and IIRC without hooking directly into the AES/VDI-trap.

> BTW: is xAAES also incompatible with Wdialog?

I don't know. But according to Henk's notes he will implement
Wdialog-functionality in XaAES itself, so it doesn't matter if it works or
not. WDialog is not suitable in anything except perhaps TOS anyway.

> Has anyone tried the Wdialog replacement PDLG.SLB under MiNT instead of
> Wdialog? Since MiNT can now load MagiC-type SLB's this might be more
> succesfull then trying to load Wdialog or Ndialog for that matter...

Absolutely not. SLB's are not TSR's (OK, they sort of are, but they are
never executed unless explicitly called), so the AES must redirect the
apropriate opcodes to the SLB. Naturally, there is no such mechanism in
MiNT og N.AES. I would also expect that the SLB access internal MagiC
data, so there would be no way to get it working under any other OS.

WHat you must consider is a partition scheme and driver that will allow you to get the maximum use out of a large drive with the STFM, this doesnt allow very large partitions, so you may find a lot of that drive space being un-accesible.

You want to revive the Atari ST there's only one way to do it.

Basically build an Atari 1040ST compatible computer with the footprint of a VHS cassette tape and it's own backlit dual mode (colour/mono) 640x400 LCD display. Make sure you keep the MIDI ports even if you sacrifice the RS-232/Parallel ports. Have a track-point or something to control the mouse. Have a built in 1.44 3.5" disk drive and 4mb memory. Make sure it gets a good running time off batteries. Build all this and sell it for $100 or less.

Now if such a mythical machine could be built and sold for a profit at that price point it would bring about an Atari ST revival. Particularily if it was marketed as a MIDI machine. Hell I'd love to have a tiny little Atari ST like that just for taking to gigs.

So if you can do all that then the ST will have a second life. Heck it would make a neat hand-held game system and PDA if you could build it to sell for $100 or less.

Almost any piece of crap can be brought back from the dead if it's priced low enough and aimed at a specific market.

P*ss off. Those who knows me here knows that nothing could be more wrong.

> Frankly I'd be surprised if you read a single word of any of them. You seem content to

Thanks, but except for that specific 86-book I've read every single page of those, and quite a few pages of the 040-manual as well. I know just as well as you do that the x86 isn't the perfect CPU (far from it), but it does have a few advantages that makes it a realistic platform:

1. It's extremely cheap.
2. Very, very, very fast.
3. You can buy it everywhere.

It would be nice to have something like this again. I haven't had such a computer (except for my PC, which I own by necessity) since the late 80's.

> Then you'd better open your eyes and close your mouth in a big hurry Jo. As I said, I
> deal in solid facts. Yes Jo, I said FACT, something that can be proven or disproven.

What's a fact? I haven't seen any from you.

> I tell you either start making positive contributions here and quit spewing blatant BS or

This is just plain stupid. What's a "positive contribution"? Something you
can agree with?

>> Btw. your quoting is horrible. Please do something about it.

> I snipped anything not from the message I'm replying to, this is nothing horrible about

You wrote your reply above the quoted text. This is wrong.

I've seen video to VGA converters advertised. I don't know how well they
perform. Remember also most VGA monitors have no audio output so if you
want sound you'll have to wire up a separate amplifier circuit.

Yes, I know perfectly well that the x86 is far from the perfect CPU,
technically speaking, but as I wrote in another message, it has other
advantages.

In in ideal world there would be more than one manufacturer of
Mac(-clones), then we could have used those.

> For me the are only 2 ways, overclocking of 68060 or a PPC emulation,

I will hopefully get a 060 in my Milan soon, but I don't think it will
take that long before that one gets too slow to. So emulation is the
answer in the long run, yes.

It is not the monitor that needs the RCA ports. My SVGA monitor does
not have the ports either. The monitor cable plugs into the VGA
converter that has the RCA ports. YOu hooks the ports of the converter
into the ports of the Video Key that plugs into the ST.

Source record: 40847

In case there is any misunderstanding of my plan, let me clarify.

The name, "Atari" means nothing. It has no value. Just like "Jared". Just a set of letters coupled together to form a word. It's only when you make an association to something or someone that it has any meaning at all.

My plan is not to license the name "Atari" purely for the sake of the name. That is as pointless as what Hasbro and Infogrames have done.

I truly hope, if anyone from Infogrames is on this newsgroup, they don't become offended, because I believe what they are doing is nothing more than "software prostitution". They are simply pimping the name "Atari" for a few dollars a night (figuratively speaking), based solely on the "recognition factor" alone. Hasbro did the same thing... and look what happened. Now Infogrames is hoping to do better than Hasbro. Will they? Who knows. One could hope, but I seriously doubt it.

When I see the name Atari today, I see nothing. I see a Hasbro or Infogrames game with a vaguely remember name tacked on to it. Sure, it's *supposed* to instill a thrill or sense of nostalgia that will make me want to buy the game. But do I? No. And I probably never will. Why?

Because there is nothing BEHIND the name. No product. No substance. No value. A name without a person is a word. A word without a meaning is babble. Babbling is pointless, useless noise-making. How often do you thrill to hear someone babble? Me neither.

I want to bring MEANING back to the name "Atari". I want people to remember that the name Atari MEANS something. It means uniqueness. It means pride. It means computers.

When you look at a game title on the shelf today that has the name Atari on it, do you honestly believe Atari produced that title? They didn't, because they don't exist anymore. They only existed when they made arcade games, game systems, and computers. All it is is a brandname today. It has no substance behind it anymore. It's a ghost of a word, no longer holding any of the pride and fun it used to represent.

I want to change that...

> controlled by MIDI as well.

Well I finally got a chance to run to the Electronic Cows "Sound Chip Synth"
software. It showed some promise but it was fatally flawed.

The midi control was terrible. It couldn't track keyboard movement anywhere
near as fast as I could play and if two notes were hit at the same time,
instead of picking high note, low note, or last note priority it simply
stopped playing altogether.

I could tweak some semi-interesting sounds out of it but unfortunately using
it for performance was a no-go because of the poor keyboard tracking.

I think what I would like to see in a program for the ST would be.

1) accurate midi controller tracking.
2) able to set low/high/last note priority for midi controller.
3) Each oscilator with it's own Amplitude ADSR envelope generator.
4) Each oscilator with it's own Pitch ADSR envelope generator.
5) Each oscilator with it's own selectable waveform.
6) Adjustable portamento speed.
7) Gate output (either joystick port or maybe parallel port) for triggering
external modules like VCF, etc.

Everything else about the SCS program seemed pretty good. I'd even settle
for it "as is" if it would only accurately track the midi controller.

What do you think? Am I asking too much from the Atari ST? I don't think I
am since there is similar software for the C-64. I should think the Atari ST
would be more than powerful enough to handle the task of being a midi synth
module.

I haven't had a chance yet to check out the EX-909 TB-303/TR-606 combo
emulator by Electronic Cow. Hopefully it won't be as disappointing as the
SCS was.

4588. new contest

Newsgroup: comp.sys.atari.st
Date: 2001-10-30 23:44:06 UTC
From: Bengy <bengy@mac.com>
Message-ID: <B8048957.4500%bengy@mac.com>
Source record: 40852

As promised, a new contest was announced today. The challenge: turn the word ATARI into an acronym! For Example:

Amazing
Terrific
Ancient
Really cool
Interesting

Pretty easy, huh? I'll even be lenient and let you use multiple words or phrases for each letter. Such as:

An Atari is my friend
Together we are winners
Age doesn't matter..
...And so forth.

The prize: Set of 3 miniature Star Trek ornaments for your Christmas tree: It all started with the USS Enterprise, under the command of Captain Kirk, whose mission was to go "where no man has gone before." These futuristic flying vessels are compilations of engineering magnificence, built to withstand extreme changes in temperature and atmosphereï¿½not to mention the dreaded Klingons.

And.. a 2002 Canadian wall calendar.

Value: about $30.00 CAD

Deadline for submissions: Sunday, November 4, 2001.

How to enter: simply send an email with your acronym to support@magical-sides.de. By doing so, you give permission to us to use your entry in any way we choose. The winner will be contacted by email.

That is correct.

> WDialog is not suitable in anything except perhaps TOS anyway.

Yes. My impression is that W is exclusively written to give MagiC functionality
away to TOS users so they can run certain programs in single TOS.

It certainly is not written to make upgrading MagiC unnecessary.
You must NOT use W with MagiC. You must upgrade MagiC in stead.

>monitor however so you may get better results.

Moire effect on the desktop is practically unavoidable when colour monitors are used, because the CRT shadowmask strips interfere with the desktop pattern. Choosing a solid colour (instead of a pattern) for desktop helps, or, alternatively, using a monitor with very high resolution- but that is probably not the way one would select.

I know that some people have successfully used -monochrome- multisync monitors to display all three ST resolutions, because the moire pattern does not appear on them and picture quality is very good- but you miss the actual colours then.

I am sorry, but isn't this a little bit like reinventing the wheel again.
I am sure that software which establishes a sort of network (including
disk sharing?) through the midi ports exists since long ago, but I can't
recall the name. It should be available on Atari ftp sites, I think.

In fact, I faintly remember that there may be several such software packages.

>[...]
>And why do you think the emulator will be second rate? Why can't the
>emulator be fast, efficient and stable/compatible?

I suppose that the element of personal taste and computer use gets into
equation here, too. Different people expect different things from their
Atari. But technically there is no reason why an emulator shouldn't
reliably mimic a deterministic system like a computer. True, it wouldn't
be very effective, compared to the raw power of the system which performs
the emulation, but still it could be much faster than the emulated machine.
If the cost of emulation is negligible (compared to the alternative of
building or bying a hardware clone), the ineficiency can be forgiven
and is probably completely insignificant.

It is also true that, techincally, a hardware replication (or improvement)
of the machine can be made with today's programmable-chips technology,
but I fear it would be too expensive. Yes, I would like to have a brand-new
Atari-compatible implemented in hardware- but it would never realize, and
even if it did, I would not be able to afford it.

I have tried some of the Atari emulators on a PC at work (I don't have a
PC at home), as much as I could afford the time. I was NOT absolutely
delighted by any of them, but if the already existing features of just two
emulators (TOSbox and Gemulator for DOS) were somehow rolled into one,
it would have been sufficiently good for me to consider using such a
setup on a regular basis. I saw that practically all (except one or two)
of the applications that I use do work well on an emulator, and some of
them work much better than on a real ST-series machine. Speed difference
is such that benchmarks show that a TT or a Falcon might be outperformed too,
which would be enough for many people. On an emulator, I can use TOS 2.06.
I can use NVDI. I can use MiNT. I can use Jinnee desktop, etc. I can set the
machine so that on power-up it boots into the emulated Atari. I can use a
high-resolution screen (i.e. something like 1024x768). It all makes a very
comfortable environment. As someone here said on a different occasion, if
in use it has the look and feel of an Atari (i.e. GUI, applications, etc.)
then the difference does not matter.

Btw. a situation somewhat similar to the subject of this thread, but on a
much more serious level, exists with PDP-11 computers. They were once an

industry-standard for controlling all kinds of machinery and other equipment. There are probably thousands of them still doing so all over the world- and after several decades of work they are slowly failing one by one. Yet, there is a great legacy of very complex custom-built equipment-control software which is not easy to replace- and why should one do so if it works. As far as I am informed, people use two solutions to this problem: 1) several companies or individuals have coded PDP-11 emulators which run on other platforms (mostly PCs) and are supposed to quite faithfully mimic real PDP-11s, even to the extent of being able to drive the original peripherals and controlled equipment through suitable interfaces, and also running at much greater speeds than the original machines. 2) Surprisingly, several companies actually -produce- PDP-11s today- but they are super-fast "PDP11-on-a-chip", made in miniaturized form on a single board using programmable logic devices.

Wow... whatta doorstop, eh? Ever listened to the floppy drive when it's actually *accessing* a floppy disk? "Bzzzt! Bzzt! Clunk! Clunk! Clunk! Clunk!" If there was too much going on in the room and the drive *wasn't* louder than everything else, I always enjoyed feeling the top of the case for the "heartbeat" of the drive, to make sure it was accessing data correctly. I found a way to muffle [the noise] a bit. Here it is:

1) Open the case
2) Fold a paper towel into roughly the size/shape of the floppy drive.
3) Tape said paper towel to top of floppy drive.
4) Close case

Now you will be able to enjoy your ST doorstop even *MORE*, because it's even *quieter!*

> It's perfect for dialing in the evening as it's relaxing to use because

> I have some perfectly good programs which I do not use enough to warrant
> buying, but are useful/interesting enough to want to keep. This is
> especially true of the midi programs. (Even more so now that various
> previously commercial programs can be had for free.)

Have to confess I was/am the same way. Never did have much respect for shareware. To me it was always second-rate stuff, even if it was great and there was nothing commercial to buy that did the same thing or do it better. However, I always had/have great respect for off-the-shelf software. I'm a "box 'n manuals" type person. Nothing else feels quite the same.

> -5-
>
> The midi works well. Plug it in and it works.

Agreed. What little I used it when I had a 1040ST and a Roland D-10. Or was it a MegaST4?

> -6-
>
> nostalgia - I just kinda like my old atari, and since it works - why not
> use it? I like the way the ST looks. I like my old atari mouse, it's
> heavy and tracks well, and doesn't accidently move around.

The "look" is part of what I'm planning on pitching. Very unique. Very grey. Very cool! I liked the ST mouse also. Doubt many would like it much nowadays, compared to things like the Logitech optical trackball or a cordless wheelmouse. Ergonomics and comfort are "the way", these days.

But the question remains... would you buy a new Atari computer, if they made computers again? Not PC-compatibles (boooorrrrring!), but PowerPC systems using a unique OS...

I'm now wondering, is this interNet newsgroup gating through somewhere as a Fido echo also? If so, that would explain the disagreeing perspectives on rules. Fido Net does still maintain strict rules that are enforcable, whereas interNet newsgroups rules and guidelines are not only virtually unenforcable, but are much more liberal and anymore subject to evolutionary change.

If there is a bridge into Fido Net, said bridge needs to be severed, as the two are not supposed to be mutually exchangable.

Here we go again...

> We regain the Atari brandname. Otherwise, we'd just be porting Atari apps
> to run under a different processor/OS platform.

How does the Atari name have anything to do with that? My Falcon runs Magic on a 68030, previously, my ST ran TOS 1.0 on a 68000, and my 8-bit ran a different OS on a 6502, and a friend's Hades runs a new version of TOS on a 68060. Not all of these machines is Atari and none of them runs the same OS on the same processor. *But* they are all able to run Atari software to varying degrees of compatibility. If a machine comes out that runs Magic or Mint/NAES on a PPC or Intel processor, running Atari software at fairly high degrees of compatibility, how is that any different? I can slap an Atari label on it or a Hades label on it, or a Mac or any PC-compatible company label on it and it doesn't change what's inside, does it?

> That doesn't make them
> Atari apps any more. It makes them X-app running on X-hardware. It's no

> WordPerfect from DOS to the Atair ST. The reason those apps were considered
> Atari ST applications was because they were *unique* to the Atari ST! And,
> if they weren't, they were usually only ported to or from the Amiga
> platform.

If they run well on any Atari-compatible OS, and get the job done, who cares where they came from and what specific hardware is powering them? It still doesn't mean the "Atari" brand name on the box is going to make a difference. And I don't know too many people who it and stare at the innards of their machines as much as they put them to use. If it doesn't exactly say "Atari", but runs Atari software, does it matter? Not in the slightest unless you're obsessed with the Atari logo or something.

> If the effort to "revive Atari" is to have ANY hope, we must go to the

> the "old ways" just one more time is simply a time-wasting "nostalgia trip".
> If we are so desirous to get back to the days of Atari's golden age, we
> must realize that it involves the NAME!

How? I still haven't seen a really great argument for why you think this. No one other than us few Atari users knows Atari as a computer company name. They may only vaguely remember that there was an Atari video game console on

their TV decades ago, which was replaced by a Nintendo soon afterward and never heard from since.

> An Atari computer is NOT an Atari computer unless it is called an *Atari*
> computer. And, none of the clones,
> regardless of their ability to run Atari ST/TT/Falcon030 applications are
> Atari computers.

How is any new machine, "Atari" or not going to be different. It's a label on a box, which few even know has any history. You might as well put "Flibbertygibbit" on the label. I could easily make an Atari label and put it on a Hades. Then what? "Oh my gosh, it's suddenly the greatest machine in the world, opposed to what it was before!!!!!" I don't think that's what'd happen.

> We are in the last days of "Atari". The fumes the die-hards have been
> running on are evaporating into nothingness rapidly. Eventually, there will
> be nothing left and no one to care. And Atari, as a namesake, memory, and
> gaming pioneer... will be lost forever...

Ask anyone on the street. It already has been.

> Say what you will, but you must answer me this. WHY do you use an Atari
> computer and the software that you run on it? Is it the applications? Is
> it the brandname? Is it the uniqueness of the hardware? Or is it just fond
> memories that keep you going?

I like it because it works well for what I want. I would love to have a newer, faster one, but if it doesn't have an Atari label on it, I'm not going to die of disappointment.

> If owning and using an Atari ST computer (or clone) is so important, then
> why isn't reviving the company that started it?

Because the company itself isn't as important as the hardware it made.

> It's not about the people
> who worked at Atari... they KILLED it, remember?

Yes, good point.

> It's not about the
> designers who made the cases (though I am still very partial to the 1040ST
> design myself), they've moved on.

I personally recased my Falcon into a PC mid-tower. I hated the old ST-style case. What a pain in the butt that was!

> It's not about the features or
> limitations of the system.

I think it's everything about the features. That's the only reason I wanted an Atari in the first place. It had unique features that weren't available on any other platform at the time.

> It's about the NAME! The company! The meaning!

Get a grip on yourself! Go to the store. Look at bananas. You might see "Chiquita" and "Dole" brand bananas. But take the stickers off and could you tell the difference? What matters is the stuff it's made of.

> An Atari computer isn't an Atari computer unless it's *called* an ATARI
> computer!

Not at all true.

> If you say that the name isn't important to you, then why do you use an
> Atari computer?

As I said, I like the features and how it works. That's all.

> If you say it's not the applications you care about, then
> why do you use an Atari computer?

Well, it is the applications, too. But they don't have to say Atari on them to be useful. Most applications I use weren't made by Atari.

> If you say it's not the nostalgic
> memories of having a computer that was ahead of the rest in it's day, then
> why do you use an Atari computer?

That's exactly right, the features that Atari put into their machines was the reason I like them. If it had been Apple, Compaq, HP, put-your-company-here, it wouldn't have made a difference. If Atari had stopped making good hardware, I wouldn't have bought it.

> Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that,
> if "Atari" were to make a comeback, and started manufacturing computers,
> PDA's, laptops, and more again... that you wouldn't be thrilled?

That depends on what they were compatible with. If they came back and made Windows-compatible machines, I wouldn't be interested. However, if *any* company (Atari or otherwise) is created that made Atari-compatible computers in the mainstream, then yes, I'd be thrilled!

> If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is

> "Success!" (I believe that's the correct translation, if memory serves me
> right).

Brand loyalty doesn't exist in the computer industry. Platform loyalty does. Atari sucked as a company, which is why it doesn't exist anymore in the capacity you're describing. Why would anyone want that company back? But I would love to see the hardware continued.

> We can't bring back the past, but we can enjoy the present.

Well said. Atari is in the past. Let's live in the present.

> I would love to
> go back to the days when The CareBear demos and STOS and Brattacas and

> and put it on an endless loop!

Then all you have to do is lock yourself in your room with your ST and all
your favorite software and pretend the present doesn't exist.

[snip ranting about the past]

> And if any one of you have even the tiniest HINT of a cranial concept of
> these same emotions, you'd realize that the name 'Atari" means almost more
> than the things they created. Shoot, they even made/sold CALCULATORS, for

> and Star Raiders as soon as they were released. The list goes on and on...

This proves your obsession. I don't think most people are that obsessed with
this. And I don't think bringing back the Atari name will do anything for
us. Just buy yourself a Hades, make an Atari label for it, and be happy.

[snip some more]

> The only thing we could do is find the programmers to port any and all

> And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't*
> "leading edge".

I would never buy a 1040ST after having used my Falcon, a TT, or Hades. And
if anything better ever comes along I wouldn't want to go back to these.
It's called progress. Atari did it, as do the clone makers. Why would anyone
in their right mind stick themselves in the past like that?

Anyway, good luck in your crusade. Hope you get over your obsession, though.
I have the same fervour for the hardware and OS as you have for the name. I
hope you can see where I'm coming from here when I say the name is
unimportant, but hardware's ability to run the software is the most
important thing in anything we as true Atarians create for ourselves.

Source record: 40864

>Jared,
>you are a sad git! A sad, sad git! When will you leave Atari users alone?

Hey, blame it on the Tandy 1000HX motherboard I ripped out of the (cool & unique!) Tandy 1000HX case that got me going again! It looks to be purely double-sided (not multi-layer). I got to thinking... "Hey, I bet an Atari 1040ST could be done on this motherboard!" And so it goes...

>Just like an IBM clone isn't an IBM PC. So what? Only a fraction of PC
>users run IBM machines!

If IBM, Intel, and Microsoft had all died way back in the XT days and no other hardware/OS compay picked up the torch, do you really think that "IBM clones" would exist today? I think not.

It's the same thing today. Why do you think that Atari "clones" (I believe the correct term would be "compatibles", since the off-shoots we have today so dis-resemble (internally and externally) the original Atari ST's, the only resemblance is the fact they actually run Atari ST software at all) are dying off? Because there is no "Atari" to "clone" from anymore! They are a branch cut off from the grapevine (well, actually, the other way around... the whole grapevine was violently ripped out of the ground and they're a branch from it that got snapped off in the process), slowly withering from lack of it's lifesource.... Atari.

PC "clones" exist because Intel and "Intel clones" (AMD mainly) exist. You'll notice that they're no longer called IBM-compatibles or IBM clones. Why? Because IBM has since long been left behind as the "clone source" from which to duplicate.

If everyone had started making "Atari ST compatibles" right after Atari was killed off and companies continued to write software for them and TOS/GEM continued to be improved upon and enhanced to this day... we wouldn't be having this argument. But they didn't and we are.

>You're living in 1986, Falvo. Shut up and leave us alone.

No, I'm not. I am fondly remembering 1986 and desiring to restore the name that MEANT something back in 1986. Not the worthless, pimped "brand" it is today. Atari doesn't mean anything today, because it doesn't represent anything but what it USED to represent years ago. *Used* to... not does.

>You're the one being driven by nostalgia, Falvo! You're the one who's
>ranting on and on and on and on and on about stupid superficial features
>like the name, the logo or the case!
>And you have absolutely no touch with reality! If you had, you'd leave us
>alone and shut the bloody hell up!

If the name is *restored* to represent what it *used to* represent, then it's reasonable to consider that a visual reminder of that representation would help restore buyer interest in the renewed "brandname" as well.

>How dare you, who are not an Atari user, who are not interested in the >clones, totally uninterested in any developments which have occured after >the STFM, come and lecture us about what being an "Atarian" entails? >How bloody dare you?

How dare I? Oh, isn't it funny to be you. I *was* an Atari ST user (VERY die-hard at the time)... but not these days. Why? Because "Atari" is nothing but a pimped whore of "brandname" prostitution today! To own an Atari ST of any kind, original or "clone", is simply denying the fact that it's dead-end computer, with *no* future, because the company that started it is DEAD!

If someone wants to prove to me otherwise, go right on ahead... PROVE to me that Atari ST's and clones and the software that runs on them are thriving like they did in the 80's and early 90's. I seriously doubt anyone will succeed. Why? Because Atari, as a company, is DEAD! And "dead" is as dead as "dead" gets. And everyone is slowly coming to accept that sad fact and move on with their lives in a non-Atari world.

I simply want to try and stop that before it is absolutely and utterly too late. As long as there is hope, there is a chance. As long as there is a chance, there is a choice. As long as there is a choice, we can TRY. As long as we try, we can *possibly* succeed!

But I see you think that is utterly pointless.

>You're a sad, nostalgic git. Go read your old mags. Ignore thrity-two bit >processors and colour graphics. Ignore multitasking and hard drives. And >while you're at it, leave us alone, and stop insulting the remaining Atari >users.

You continue to fail to see the point I'm trying to make. I don't want to sit in my (!!!) rocking chair and "remember how it was" (if I wanted to do that, I'd spend $500-$1,000 on a Falcon030 and jerk-off, making .MOD files, I *used to* compose on my Falcon030 years ago). I want to MAKE A DIFFERENCE! I want to restore "Atari" to a company that *made* a product that people *liked* and *bought* and *enjoyed*!

Before you continue ranting about what a "nostalgic git" I am, please try to actually see the forest for the trees, kind sir?

Jared

<big snip>

Your obsession with the brand name is really odd.
If you haven't been into the atari platform for years and years, I don't think you are the right person to either bash those who were nor take things further.

Some of the crap you are writing are pure insults to the people who actually have been making a difference in making the TOS/GEM platform moving on.

The name Atari is now part of a commercial jippo from Infogrames, learn to live with it. And learn to know when to quit, I seriously hope you are one of a kind on this matter...

/Joakim

Both Steve and myself have much experience with FidoNet Technology messaging in the past, so it's not surprising that some of that experience leaks through in here - since the FTN all but closed (and I'm including the other networks such as Atarinet under the FTN umbrella) this and the other Atari usenet groups have taken their places in our hearts.

>are enforcable, whereas interNet newsgroups rules and guidelines are not
>only virtually unenforcable, but are much more liberal and anymore

Rules like it or not are there to help the user, and help to keep newsgroups (at least THESE ones) down to manageable sizes. Bottom-quoting and over-quoting have their places (it seems) in Windows-orientated places. I know we can do better than these.

>If there is a bridge into Fido Net, said bridge needs to be severed, as
>the two are not supposed to be mutually exchangable.

The sysop of the two systems that Steve and I used made selected newsgroups available as local echos for their users, and IIRC used the internet to transfer echos across the Pond.

> > frequency and the macOS 68020 emulation !

And 15% of 030 (50mhz) is a LOT LESS as 27% of 500Mhz PPC ;))

Seriosly, this is perfect way to explain a bit more what i meant: This comparision shows how good and diferent original Atari was.. We talk about 92 machine here, with acc, still it is old machine, old cpu and 12 MIPS, but "diferent" arhitecture allows us to run such apps today.. also it shows how much MHz's and MIPS'es count in reality (they apply on cpu only, and are accurate only for very similar cpu's, but fail if machine has diferrnt arhitecture). Im aware DSP took the major work here, but it was Atari who decided that DSP will be built in in a way that allows multiple tasks (mpg, mp3, jpeg decoding, voice recognition, gfx filtering....) so it is a standard configuration...

800/400 series hardware survived test of time, ST's as well and as we see Falcon's too.. thats why i prefer original machines, or hardware clones (esp if a bit peculiar) over emulator thingies... Im not against faster machines etc, just we cant stick "Atari" label on anything with fast CPU..

No, its is bug in Porthos's detect routines... Author will (did already
i think) fix that.. Wdialog is needed for many apps, and they dont
complain. Author seems dont have acces to NAES as such bug can happen
realy easy and will be fixed so no problem, just check paage regulary for
new version... :)

Hi Bengy,

My fault again for not keeping up with the NG!! You said so much, in a previous 'mail. It would be the logical thing for ROM to do. Dennis says that their first platform is the PC, with the atari as a sideshow. That makes commercial sense, however uncomfortable. With the future of the Mac now firmly tied to the OS X.* it would be very short sighted of ROM if they did not develop for the Mac. There is definitely a market of millions for Papyrus in the Mac world, where MS Word has overblown sway.

BTW thank you very very much for keeping the Atari flag flying, against all commercial sense. The same goes for all and any one still developing for the platform, under any guise or emulation. You/they do it in substance for nothing. Thank you again.

Bob King

Source record: 40873

Hi all,

I just uploaded on my WEB page the november release of my
software Eureka. It's a 2D Graph Describer and a 3D Modeller.
If you know German language, Matthias Jaap has written about
it in the october release of ST-Computer, and I would like
to thank him. About Eureka, the main update is around the
translation. In facts, Olivier Liess has kindly proposed his
help for the translation of all the formulas of Eureka (*.FMU)
in English. It is a really nice work, and I really thank him.
Any remarks on all this work are welcome. Beside this, I had
thought to make a "light" version of Eureka again. Such a
version was placed in the latest floppies of french STMAG.
It's a 68000 version that works in 1 Mb of memory, and that
can be placed on a 720 Kb floppy. If you need this "light"
version for a ST, or even a STacy, anything, you can contact me,
and I will send you this version. If many people need it, I
could put it for download on my WEB page.

Thanks to all,

See you soon for more news about Atari front-line ...

Actually they could probably market a screen like that for $100, if they
went with a non-backlit screen like the Gameboy.

But that would suck in a dark club.

So until technology advances to the point that such a system could be built
that cheaply there's really not much hope that anyone would buy a new ST.

> Do you pay by the second for your IP use Lonny?.
>

Then don't read the freakin' newsgroup, dummy. if you are so concerned. exactly how much is it per second for internet access? a penny? if so add up the amount of penny's as to how many of ben's posts there are over the period of a year. i bet its like 50 or 60 cents or something like that (over a years time). If you are so darned concerned about that kind of money, you shouldn't be able to afford a computer much less internet access.

if i am totally wrong (if its like a dollar per second or somethingg like that) i will take what i said back.

if you are so concerned about the small change cost for one of bens posts and you are upset over it because of the "principle" then thats just silly. i think you have "wasted" more money with this debate than you ever would just ignoring ben's posts.

like others have said, just DON'T download the messages when you scan the headers!!!

Thats a good point actually, hi-res mono monitors are *very* high quality,
large and almost
worthless nowadays, I'll try one and let the ng know how they look on an ST.

Should reproduce the desktop very well - but as someone noted, no color :(

Thanks for the offer Edward but I dont think it will be necessary, the is a
large number
of interpreters available for download and some of them are turning out to
be developed
further than I expeted. Mupfel is fantastic, but does anyone know how to
change it's
language to English? Also Mupfel man files are in German, anyone have the
English versions?
If not, I'll probably convert them all to English as a small contribution to
the apps development.

Another interpreter I found was pcommand, it is *very* lightwieght (no
command history, tab

complete, etc) but if you like ms-dos it can be configured to be *exactly* like ms-dos 5, not
very useful for most things but good for making a boot disk for your ST - the whole interpreter
is 38K bytes! (doesn't have a doskey replacement though..)

The best one I've found is Galum (posted by someone on this ng), it is a *very* polished product.
It's going to take a while to discover the limitations.

Thanks,

Dan.

thank you Michael, Uwe and Stephen for your advice.

I could not get the original MagnumST card to recognise all
of the SIMM memory, so finally I decided to change the card
for an other one at the local Atari shop (it appeared he had
plenty of them on stock) ... and the other card worked
instantly!

best regards,
Dennis

last night I picked up a copy of _Computer Music_ (issue 39) and read
an excellent article with Howie B (who's worked in Passengers and with
Bjork), who raves about the Atari 1040ST/Notator SL setup he uses
alongside Pro Tools as the main sequencer in his studio system:

"it's great because it talks to everything, it's incredibly stable,
and in seven minutes you can get it up and running in any studio in the
world".

If Howie is one of those people who are "running on fumes" as Mr.
Falvo is blooking out, I want some of what he's sniffing! :)

Threads on this subject invariably waste more bandwidth and download time than the advert itself (and this message is evidence of more).

Complaints about commercial interruptions would be valid where there was a glut of support, but here there definitely is not. In a PC message base the situation would be the reverse.

Can we have a vote on a website somewhere to accept commecial adverts on a once a month basis so we can do away with this sterile debate?

I pay for my online time by the second too, but this message must cost me a fraction of a penny a month. We shouldn't complain IMO.

Would we be happier if there was no-one to advertise anything?

Hi

I guess u dont do GEM program, but some fullscreen app, maybe game? In
that case u need to get and save physical and logical screen bases on
begining of your program and move actual screen adress to another location
untill u exit application.
If u dont do that, you will draw on same screen as system did before and
u loose draw content (usualy u need to redraw screen manualy after u quit)

You can save actual physical and logical screen adresses like this:

```
old_physbase%=xbios(2)
old_log_base%=xbios(3)
```

Now, when you have that saved (for restoring later), you need to set new
screen adressess:

```
~xbios(5,L:new_physbase%,L:new_logbase%,-1)
```

new_physbase% and new_logbase% are adresses where u want to move screen
for your application. It is smart that u reserve those before. U can use
DIM and VARPTR for that etc.. For quick test, new_physbase% and
new_logbase% can be just old_physbase% and old_logbase% + 34000 (screen
size on ST)
All text and drawing will be now done there. U can now do whatwer u do
in your apps. When u quit your program, u must set screen to old
adresses!! Again use xbios 5 (setscreen):

```
~xbios(5,L:old_physbase%,L:old_logbase,-1)
```

That shold do the trick.. Also that way u will prevent that apps "under"
yours will pop out...

Janez

Believe it or not, the C64 had a better sooundchip than the ST. The ST got it's
good reputation among musicians thanks to the built-in MIDI interface, and the
good MIDI software that was written for it. To get a good synth sound just hook
up a REAL external synth(module) to the MIDI ports. The internal Yamaha soundchip
isn't any good.

Source record: 40799

An Atari clone exists because there once WAS a company, named Atari, that made computers. Had they never made them, there would be no clones. The reason Atari clones are dying is because the founding company that made the originals (from which the clones sprang), is dead. And software manufacturers realize this, so they stop making Atari software. Computers without software (or computers that are aging with software that is utterly ancient) are nothing but a pile of electronics that either do nothing or they do something... but nowhere near as well as they would if they were more modern.

If Atari were to make a comeback, with sufficient impact and promotion and uniqueness and support from end-users, developers, and Atarians in the US and around the world, I have little doubt that it could enjoy, at the very least, a niche place in computing as it once did.

Tell me this, if you could run the same apps on the new Atari computer (via emulation or a hardware expansion), while having the knowledge that you had a system that was far more powerful and capable (as well as actually having a *future* once again) than before, you woudn't run out and buy it?

If we do nothing... if we don't even TRY... eventually it will all end. Completely. It's inevitable. If you're willing to live with that, so be it. But not me. I think Atari, as a company (Atari as a brandname just simply SUCKS RAW MOLTEN LAVA and means utterly NOTHING to me.), deserves another (better) chance, if we can give it one. It's not just the name I'm after, just because of what it means/meant to a lot of people, but the products they produced.

Try this for a test:

Think of the name Atari. Now, write down how many things they made (games, systems, etc.).
Think of the name Sega. Do the same.
Think of the name Nintendo. Ditto.
Think of the name Commodore. Likewise.
And Taito.
And Gottleib.
And Namco.

Now, think of games and arcade games you played in the past and try to remember who made them (assuming the list is not redundant in the reverse).

I am willing to bet, you will make a far easier association between Atari and it's products than anyone else. In fact, I am willing to bet you can recall some games that were more unique and memorable than the companies who made them... but few of those games will be made by Atari... because Atari

WAS the games it made and vice versa.

This is what Hasbro and Infogrames are banking on. But, what they don't realize is that Atari wasn't just a brandname thought up for use by another company... it WAS a company. And a company that MADE products!

People have long since realized that "Atari" is no longer the embodiment of a company that makes a product, but merely a name used by another company to pitch a product THEY make.

I call it, "software prostitution". And no one has respect for a prostitute. Why? Because all they're selling is their body. Not love or devotion. All Infogrames is selling is *their* product (making a profit) using the waning popularity (sex appeal, figuratively speaking) of a name that USED to mean something.

It won't work... at least not for much longer.

All I want to do is get "Atari" off the street corner and making an honest living again. People respect that. Don't you?

And, if Infogrames has any sense, they're gonna realize they'll be able to sell "Atari"-branded games a lot better when there's actually a division of "Atari" that is more substantial than just a name people remember from the past...

That the C-64 had a superior sound chip goes without saying. However, I don't think it's a stretch to say that a 1MB 16-bit 8mhz computer with built in MIDI should be capable of driving it's soundchip through MIDI better than a 64KB 8-bit 1mhz computer can.

On that SCS software I could play a glisando on my keyboard, got out and grab a quick one at the pub, and be back before it played the last note.

Turning an ST into an emulated analogue modular synthesizer controlled through MIDI is just one of those "because it's there" projects. Something that's been done on other computer platforms and should be doable on the ST but currently isn't (or currently isn't done well).

Even if we forget about emulating the VCFs and go with external VFC modules (which would be cooler anyways), just creating a program for the ST that lets it emulate the VCOs with pitch envelope generators and the VCAs with their ADSR envelope generators just seems like a really cool thing to me, and it's a really inexpensive start for hobbiests who want to build a modular synth because the toughest and most expensive part, building MIDI controlled VCOs/VCAs/and their respective envelope generators and a gate for external modules will all be taken care of by an Atari ST (which could be found for $10 in a thrift store) and a piece of software which could be made available on the net. That's a pretty attractive start on modular synthesis if you ask me. I'm really suprised this isn't an idea that hasn't excited anyone before but me. Heck, just customizing old Atari STs into midi controlled modular synthesizers will increase interest in the old Atari ST platform.

Actually, it would be more useful to license the source for TOS, or
better yet get them to release it publicly. They have no use for
TOS source. They know exactly what they have with the brand name
"Atari", and will not likely share the very thing they were after
when they spent all that money.

I don't want to revive the Atari ST... I want to revive Atari as a company that made products. The 1040ST case idea is just to help promote familiarity of the old with the new. Other systems would possibly look different, if not be just new Atari computers in tower cases, though I tend to frown on that bland concept. I think innovative case design is a trademark of the Atari we used to know and love.

I see you're one of those that believes that you have absolutely NO control over the fate of Atari. It's someone elses brandname and you're the sad pawn in a really bad game of chess.

Well... "Homey don't play dat game!" (WHOMP!)

If we do nothing, nothing changes. If we at least try, something *may* change. I really wish people would stop accepting things the way they are and at least consider the slightest chance that things could be different if we actually TRIED!

The people who have been "extending the TOS/GEM platform" do so, to end in certain failure at the end of their road. Without Atari, there is no lasting continuation in the Atari ST platform... at all. And we're reaching the end of that road right quickly.

I simply want people to see that if we at least TRY to make a difference, by reviving Atari, not just as a brandname, but as a company, that a whole renewed future would be opened up to us... Atari clone users and genuine Atari users alike.

But I see you're one of those that accepts your "fate" and doesn't even try to change it. Who knows, you might die of shock if Atari actually did come back (and you had some part in it)! Don't wanna risk THAT, now do we?

Thanks for highlighting the availability of public keys, Hallvard.
I've been glancing at this program for a few years because of its
ability to add extra windows to handle fonts, the Magic apps folder
etc.

What were you looking to find out? I'll give it a try...

> Because it would be... an Atari!

You know what? So would I! You're right about those fun years when the ST
was at its zenith. I really enjoyed the systems and the software back
then. I still do today, but it really isn't the same. I think that the
size of the community has something to do with it. When I was strictly an
Atari user I really felt a bond with other members of my local Atari users
group because we were a relatively small crowd. I loved calling the Atari
BBSes and reading the few Atari publications.

It's just not the same, even in the Mac community.

Ah well, those days are gone and I don't think we'll ever see them reborn.
But if, by some miracle, somebody got the venture capital, bought the
Atari name and started making computers, you bet I'd buy one. I'd love to
fly in the face of the majority once again. :)

Hi Jarod,

Did you read my post at all?

> I see you're one of those that believes that you have absolutely NO
> control over the fate of Atari. It's someone elses brandname and
> you're the sad pawn in a really bad game of chess.

The name is not important, the platform is. And I don't think we have absolutely NO control over the future, but I am not stupid enough to fight for things that:

a) don't matter to me (why would?)
b) would be a huge waste of energy (bugging Infogrames about licensing the brand name)

And I am pretty sure it is you are the one having a sad pawn because of the brand name. You are the one interested in the brand name, not me.

> The people who have been "extending the TOS/GEM platform" do so, to
> end in certain failure at the end of their road.

Even IF that would be so, they have been the ones breathing life into the platform you at present time haven't got a clue about. If you dig the name this bad, start making t-shirts or posters or whatever...

> I simply want people to see that if we at least TRY to make a
> difference, by reviving Atari, not just as a brandname, but as a
> company, that a whole renewed future would be opened up to us...
> Atari clone users and genuine Atari users alike.

The name is not important (no, it is not an echo, I actually had to write that -again..)

Lets work with what we have, not what we had. Wake up..

> But I see you're one of those that accepts your "fate" and doesn't
> even try to change it. Who knows, you might die of shock if Atari
> actually did come back (and you had some part in it)! Don't wanna
> risk THAT, now do we?

"I see you're one of those.." strange retorics. I think it willl be needless to try and point me out, since I have a hunch few ppl agree with you. At least, I hope so.

These are your words, you can think whatever you like about me and other who don't agree with you. I don't consider you all that relevant to the atari platform of TODAY, so I won't bother to take you seriously.

However, I believe you have said all this before. And said (a number of times) that you give up because you did not get the response you hoped for in this forum.

Why not keep that promise?

/Joakim

>makes commercial sense, however uncomfortable. With the future of the
>Mac now firmly tied to the OS X.* it would be very short sighted of ROM
>if they did not develop for the Mac.

I did not say, suggested or even hinted that ROM wouldn't produce a Mac version of Papyrus. I don't have a clue about what ROM is up to, and to be honest I don't really care either. It's no secret that I don't like Papyrus... of all the wordprocessors I ever used I find it to be the most illogical, furthermore it's dead slow and has some features missing which are a necessity for me. The only thing I like in Papyrus is the database, unless that in version 9.0 some long promised features will finally be implemented and the shortcomings of version 8.0 are adressed I'm through with it.

Dennis

Hi Joakim,

>I'll second that. Downloading the whole newgroup is your choice.
>Can't blame anyone else for doing that really. Even NEWSie will let
>you scan the headers before downloading posts.

Don't stray away too much, the topic is not about saving pennies or cents
but about Sierra Bravo wanting our money...
Scanning the headers and sorting out the unwanted postings also costs time
and thus money. In a group where the average traffic is roughly 60 postings
a day scanning the headers is a waste of time, downloading the whole lot
will probably be faster and thus cheaper... and one can always use a filter
to weed out the "undesired" postings.

What needs to be adressed here is the attitude and common sense, we either
allow dealers to spam in here or we don't. IMO if be don't object to it we
put the door wide open to all kind of abuse. ATM it's not really necessary
to scan the headers, allow spam and you'll have to go searching for the
posting between all kinds of crap.
There isn't one acceptable reason IMO why a commercial enterprise should be
allowed to advertise here. There are plenty alternatives on internet to get
in touch and/or reach potential customers. From the minute one opens his
eyes in the morning he's subjected to all kinds of advertisements, we're
bombarded with it (metaphoric that is). This newsgroup is one of the few
places where we are left in peace and no one is out to get their hands on
our money or tries to sell us stuff we don't really want. I would love to
keep it that way...

Cheers from Belgium
Dennis

From: "Jared Falvo" <luposian@azob.quik.com>
Date: Mon, 29 Oct 2001 14:31:51 -0700

Hi Jared,

>And if any one of you have even the tiniest HINT of a cranial concept of
>these same emotions, you'd realize that the name 'Atari" means almost more
>than the things they created.

These are blurred emotions... One tends to get emotional when reflecting on
his first computer, car, hifi, girlfriend etc.
Ask an Amiga or Apple user how he felt the very first time he booted his
machine and you'll get the same reply. Today a kid who unpacks "his" PC and
boots it for the very first time will also feel and remember these emotions.
The brandname Atari is not relevant at all in this story.

>And, none of the clones, regardless of their ability to run Atari
>ST/TT/Falcon030 applications are Atari computers.

Have you ever seen a Milan or Hades? or better yet have you ever worked with
one? I think not because otherwise you would not be writing nonsense like
this.

>If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is
>an issue of pride and trust.

You were still sucking your thumb and playing with tin soldiers when I
bought my first Atari. Please don't come here telling me how I should feel
and behave. I find this to be rather insulting. Especially since it's coming
from someone who has shown time and time again that he hasn't got a clue
about the Atari platform anno 2001.

>An Atari computer isn't an Atari computer unless it's *called* an ATARI
>computer!

An Atari computer is just a collection of chips thrown together... open up
the darn box and take a peep.

>computers that had an OS that was simple and fun to use, but more powerful
>than TOS/GEM was, had some really nice hardware under the hood, and boasted
>of "Power Without the Price" again...

The Hades and Milan computers fit the bill. All what's missing it that Fuji
logo, order a couple from Best Electronics and stick them on the box. And
please don't reply telling me that these computers aren't capable of running
those "nostalgic" games you love so much. The TT and Falcon can't run them
either and these two computers are "real" Atari computers according to your
twisted logic.

>Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know
>what? I'da bought one.

Why doesn't this surprise me one little bit? :-)
They also sold umbrellas and PC's... if you finally wake up you'll realise that Atari was just an ordinary enterprise selling whatever the customer wanted. Their only goal was to make money, once they started loosing money due to a lot of reasons and shares fell they closed the books and dumped the whole lot. How's that for nostalgia ?
Has anyone here got an old Atari PC gathering dust somewhere? If so please send the case to Jared so he can fit his PC in that case and have a "real" Atari.

Jared, I have very fond memories about my Atari 800, but if someone out there was going to build a batch and revive the 8bit platform tomorrow, I wouldn't be standing in line to get one. The ST was a very innovative computer back in 1985, sixteen years later it's time to put it to rest. I`m not implying it's unusable, thousands of people still enjoy using it everyday. But the biggest majority in this newsgroup has moved on quite a bit. Personally I don't give a damn about the ST anymore, it's nearly 10 years since I used one. I get the shivers to think I would have to crawl back again after that little black and white screen....

If you really want to do something for this platform then go get your coat and start looking for some very talented programmers willing to write some innovative stuff for this platform. But please do not even mention the word "ST", we need software that adresses and use the features of the Milan and Hades. Some remarkable software has been written for the Mac 68040's, go and find the authors and convince them to adapt/port these so it can run on the Atari clones... If software like this would appear I'm convinced that within a year the majority of the people here would have either a clone or upgraded their computers. But this will not attract any new users, it will only keep us going for a while longer... if you can pull *this* off I'll jump on the first plane and come and thank you personally ;-)

Oh yes, you're much to ambitious IMO. You'll need a very strong business plan to convince potential investors. To generate the necessary cashflow I suggest to start small. Reviving the Atari calculators productline first would be a good step. All you need to do is order a container full of these in Taiwan and relabel them. Then it's only a matter of selling them at daylight robbery prices, that's exactly what Atari did .... with the money generated from that project you can then build your first ATARi ST2002.

Cheers from Belgium
Dennis

Hi Jared,

>I truly hope, if anyone from Infogrames is on this newsgroup, they don't
>become offended, because I believe what they are doing is nothing more than
>"software prostitution".

I truly hope that someone from Infogrames is reading your crap.... he would beyond doubt correct you and remind you that Infogrames wrote some brilliant games for Atari in the early 90's.
He would probably also inform you how Infogrames started life (two talented French Atari programmers programming brilliant games for their favourite computer). Has it ever occured to you that the owners of Infogrames might be just as crazy as you about the Atari label and bought it purely for nostalgic reasons?

>They are simply pimping the name "Atari" for a few dollars a night
>(figuratively speaking), based solely on the "recognition factor" alone.

For the record: Infogrames was one of the last softwarehouses that left the sinking ship. They've supported the Atari platform until the day that is was costing them truckloads of money.

>Hasbro did the same thing... and look what happened.

No, for Hasbro "Atari" was only an asset. One that landed in their very large portfolio of shares. And then they used the oldest trick in the book: create a lot of fume and loose a lot of money (on paper), once that's accomplished they sell the shares to another multinational giant willing to play the same game. It's simply a tax evading manouvre, every big enterprise simply needs a post to write off large losses, look at what has been happening to Commodore the last six years... every year the shares are bought and sold, every owner writes off enormous losses. In the banking world we call this the "dance of death", but "creative accounting" fits the bill also. It's a perfect legal construction and can be repeated time and time again. Atari *started* the dance when the Tramiels sold the Atari shares to JTS. There are no loosers in this game, everyone wins except for the taxpayer ofcourse who pays the bill of this pervert system.

It will take a lot of Jared Falvo's to stop the "dance of death" :-)

Cheers from Belgium

hmmm, no, that's up to YOU to prove your claims, not me. Many Milan
owners found quite the opposite.

You fail to see the point about PointCast - you brayed loud and long about how the technology would force Atari users from the net. Instead, Pointcast crashed and burned, and we're still here.

ah, once again TiFKAS attempts to attack the labourer as being unworthy. Remember, labourers and salespeople make a great part of an economy and their money buys computers - which means they pay you wages, pinhead.

Dan,
There used to be English versions of Gemini/Mupfel. If you can't find any
on the net post again and
I will send what I have.
Dave.

Straying away? It seems to be one of the reaons Steve brings out to explain why he thinks it was inappropriate postings. If it is a problem that I reply to what is contained within the previous posting, I won't bother posting again.

Threads do evolve to cover more than just one simple question.

> Scanning the headers and sorting out the unwanted postings also costs
> time and thus money. In a group where the average traffic is roughly
> 60 postings a day scanning the headers is a waste of time,
> downloading the whole lot will probably be faster and thus cheaper...
> and one can always use a filter to weed out the "undesired" postings.

I don't agree scanning headers is a waste of time, but that is a matter of taste then. But what is true, is that you could add any sender to the killfile if you don't like what they have to say.

> What needs to be adressed here is the attitude and common sense, we
> either allow dealers to spam in here or we don't. IMO if be don't

One could argue what is spam, and what is not. Personally I don't mind Bravo Sierras postings, even though I am currently not interested in their offers. I do see why ppl are questioning their right to post, and that discussion might be healthy. If it is a discussion, not if it is all about throwing foul language around. I could visit the nearest high school or so if I'd be interested in offensive langauge.

Calling posters (even if you don't like them) asshole and whatever is by far more abusive than posting stuff some may call spam. And definitely generating more hard feelings and bytes to download. Disrespect is worse than spam any day if you ask me.

Just curious, if someone is posting news about a commercial/shareware program being updated in this forum, is that spam too? Where do you draw the line?

/Joakim

On the chapelie you'll find Okami but that's on old version. The current
version of Okami, which is btw v 3.B02, can be found on the homepage of
the author http://www.xs4all.nl/~josdb/okami.html.
It's indeed not that easy to install but it's certainly worth the pain.
It's a offline reader so you need a program to retrieve mails/news. This
can be done with the combo Popwatch/Newswatch. Both are on the Belgian
ftp-server. If you have an unix shell account somewhere you can also
uqwk to retrieve/send message too.

CU,
Martin

> If Howie is one of those people who are "running on fumes" as Mr.
> Falvo is blooking out, I want some of what he's sniffing! :)

In this instance, a 1040ST user (musician) has found a niche from which he has no need for more power, better software, or a better computer. He is truely content where he is, using this computer. I wish we all could be. I'd still own a 1040ST (well, maybe a MegaST4... I grew to like it more than the 1040ST's case, for hard drive usage... stacking the MegaFile30 under (or above?) the MegaST4 was so tidy!) if I were like this man.

But I guarantee you, he doesn't use his 1040ST for much more than that. It's simply too old and out-dated! 16 colors, 320x200 low resolution, only 1Mb of RAM (without expansion), etc. Excellent for it's time, but not today. If you *still* use it for what it could do "back then", you will be content. Otherwise, you won't.

The Internet is 99% of my computer usage today. I play games every now and then. Any Atari unit wouldn't suffice for this need. I run in 16-bit color as an absolute requirement and prefer 24 or 32-bit. I have nothing but a DSL line out to my workshop in the backyard (it used to be a phone line, but after DSL, I'll *never* go back to a modem!), so I need an ethernet port.

I am very happy for this individual. He is still happy with his 1040ST setup. I wish I could say the same. But the world has moved on and I, along with it. There is nothing I used to do with my 1040ST, MegaST4, or Falcon030 that I do today. However, I do miss making .MODs. Some of my best ones I made were composed on the 1040ST/Falcon030. That's about the only thing I'd like to own a Falcon030 for again...

If anyone wants to hear a couple of them, just ask. Seems I'll never find a use for them outside of just listening to them every now and then. I think some of them would be excellent for a game or two.

Jared

> Actually, it would be more useful to license the source for TOS, or
> better yet get them to release it publicly. They have no use for
> TOS source. They know exactly what they have with the brand name
> "Atari", and will not likely share the very thing they were after
> when they spent all that money.

That would be part of the request. :-) GEM is already under GPL. That means it can't be copyrighted by any individual. I'm hoping that Atari's TOS/GEM is exempt from this category, because then... you could improve upon it (expanding on MultiTOS for usage with current technology) and still copyright it under Atari.

If "sharing" (via licensing) the name Atari meant making MORE money at the same time, from sales and profits in a division they'd never venture into (not to mention the potential profits from selling their "Atari"-branded games for the new Atari computers), I think they'd be stupid not to consider the offer.

Remember... THEY own Atari. Name and assets. Kit 'n kaboodle. We just want to revive the parts that they're just sitting on (or have stuck in a closet), by taking a branch of that name and permission to access the attributes from it.

Look at the Atari logo today on a game title. It's so... different. It hardly resembles the classic logo of the past, with the smooth, rounded word "Atari" and the fuji symbol with radiating colors flowing down. Ah... all you have to do is even look at Centipede for the 2600VCS to remember how nice it all was.

Tell me this, how many people do you think still associate "Atari" with much anything but past gaming? People like you and me still do, but we also remember some great computers and games they made for it, too!

The name "Atari" will rekindle memories anywhere it goes, but it HAS to represent more than JUST memories. The more it's out there, the more memories that will be rekindled. The more rekindling we do, the more money that can be made.

Based on that prospect, alone, we're simply helping Infogrames make MORE money in a department they have no interest in! We're doing the work for them and paying them to watch us do it! I'd sure jump at that, in a heartbeat!

They make money by the licensing of the name Atari. They make money from every product we (the new Atari) sell. They make money from every game they sell on every product/computer we sell. All we do is keep enough to pay our employees, keep the business running and expand it (as needed)... as the

Atari of old unfurls from the ashes of it's untimely demise!

Whoooo! Gotta get stoked on that, man!

However, if Atari never meant anything to you as a name or a company or the products it made, then this idea probably wouldn't interest you... ;-)

Jared

P.S. Assuming you ran this "new Atari", what is the first product (computer or not) you would make and what would it do? Be creative!

Two things, "gosmase",

1) You really, really must learn to spell my name correctly.

2) You really, really should start to think about what *could* be instead of what *is*.

It never hurts to dream a little, yaknow. Even if it never happens, it's nice to have something to think about. Does the Atari system you own have a future? Will it ever be expanded with today's technology? Will more software be written for it or upgraded/improved as technologies or needs advance? Um... I think... *NOT!*

I want to change that. That's all I've ever wanted to do from day one. I don't see why so many are so adamantly opposed to it. Really! It's as though people actually prefer being in a futureless state with their Ataris than trying to give their Ataris a new future. *sigh*.

>BBSes and reading the few Atari publications.

The size of the community has only shrunk because the company they followed
after was stabbed in the back! I want to try to bring the dead back among
the living. But I need more than just me yelling at the top of my voice and
writing to Infogrames and saying:

"Yeah, I'd like to help you make more money by re-creating the Atari
computer division, but... um, I'm the only one who seems to want to do so."

Oh yeah, that's just gonna move mountains, huh? NOT!

You have to realize that, unless THEY can make *more* money by giving us
what we want, they won't care a rat's hiney about it. We have to appeal to
THEIR monetary interests if WE'RE to have what WE want in the process.

>It's just not the same, even in the Mac community.

Agreed. As cool as a 876MHz G4 is, it's just not an Atari. :-)

>Ah well, those days are gone and I don't think we'll ever see them reborn.

>Something's definitely upsetting it I'm afraid.

I've found what's wrong. Dennis suggested to me that PhotoTip will
only work properly with Magic or Mint. So I booted up with MultiTOS
and lo and behold - it works. Except...

It doesn't actually display an image, but puts the desktop into the
image window! Suspecting this might be a fVDI problem (I've had
things like that happen before), I disabled fVDI and tried again.
This time it worked completely. Except that my system then runs
extremely slowly in 256 colours with MultiTOS...

I've tried some obvious combinations of fVDI settings but none work.

Grrr - I hate it when modern programs don't work with each other. It feels
like Windoze! Now I've got that formidable task again of persuading
the author of PhotoTip to make it compatible with vanilla TOS, and the
author of fVDI to make it compatible with PhotoTip.

You're absolutely right... the name is *NOT* important. It sure doesn't mean a solitary thing to me when I see it today on a PC game box. It's what's *behind* the name that matters and the name *has* to be there to *represent* that. And there's nothing behind it these days. I want to change that.

But you just CAN'T see that, can you?

Message-ID: <pkiE7.408$0h4.24362033@news.incc.net>
Source record: 40844

Before any of what I am proposing can even *hope* to have a chance, we have to find users of original and clone Ataris who are willing to put their nay-saying aside and at least put "an ounce of chance" into the mix. To allow even the tiniest possiblity that it could work. That we could succeed.

Realize this:

Companies are run with money. Companies are bought out, into, or merged with with money. Licensing of company assets take place for money.

I do not see any reason why Infogrames shouldn't be willing to license a very familiar brandname they now own, plus access to the assets that went with it, if it stands to make them even more money without costing them a cent to do so!

1) We pay them to license the name Atari (ka-ching!)
2) We pay them a sizable percentage of our net profits from sales of products we sell under the revived Atari hardware division (ka-ching!)

The only way they're out any cash is if they decide to port their game titles to the Atari computers we make.

It's like getting free money put into your bank account, just to walk into the bank and authorize them to use your name in ads that say how great a bank they really are (every time you walk in!)! Would anyone pass up a deal like that? I sure wouldn't! You don't even make a deposit and they give you money just to use your name!

That's really all we'd be doing... giving them money to give us license (authorization) to use their name ("Atari") in ads that advertise a really nice, new product (when we've actually created it, that is). And they get paid on every one we sell, too!

Point me out if I'm wrong, but... doesn't that seem like an awfully sweet deal for Infogrames to just pass up? Sure seems like it to me.

They make money with the Atari name their way. And they make money with the Atari name our way! We just start up the gig, run it, and keep enough money to pay our employees, keep the shop going, and expand a little, as needed.

Is it really that bad "working for someone else" when you get all you want out of it, too?

Sad to say, but unless we can muster up more millions than the millions Infogrames paid for the whole Atari "kit 'n kaboodle", licensing is the ONLY (hopefully affordable)way we can have our cake (recreate Atari, the company) and eat it too (make it better than it was before).

If we can do it... I'M ALL FOR IT! Sign me up!

But it takes more people to toss out "just a thread of hope" and say "Ok, let's give it a shot... where should we start?" and less people saying "It will never work... you're insane for even thinking such nonsense! Let us stay just as we are... we're content with how Atari ended up and where we are today because of it."

>My misunderstanding...where does the Video Key plug in to the ST?

The Video Key plugs into the monitor port on the ST. It has some RCA
jacks that can be used to plug into the video converter which plugs
into the VGA monitor. Mind you, the picture you get is not the best,
but it is usable.

YOu can get those at most any dealer that sells Atari hardware. You can
also get the PC Serial Mouse Adapter which will allow any ST to use any
PC serial mouse. That is what I use with my Hades....

Try the sites below:

I have NVDI 5.x. I bought Magic 4 about 4 years ago, but it wasn't reliable enough with the Falcon. XaAES might be an option, but that opens up a whole new realm of incompatibility with all the programs I currently run! I would have thought that if things don't work with MultiTOS then they've got no hope with anything else.

True on both levels.

You are right that you shouldn't have to put forward the effort to killfile
someone who is using bandwidth in a manner you find objectionable.

You are right that it is easy for me to killfile you with a click or two in
OE as you have contributed more to off topic and cross posting, taking more
bandwidth, then Ben has in the last year.

Thanks for reminding me or both items. I would suggest you follow your own
pet criteria and don't force more people to do an extra click or two to
killfile you if you are sincere in your beliefs.

(Excuse for my bad English: I am italian)
Anyone can help me?
Many years ago I used an Atari 1040 ST to play music. My favourite program was C-Lab Notator.
I don't like to use Cubase or any other programs.
How can I use now on a PC that wounderful program?
How can I reproduce my old arrangements maked with C-Lab Notator?
In few words, it's possible to reproduce that arrangements on my PC? Did you know if there is a C-Lab Notator version for PC?
Thanks.

Well you brought the cost aspects up, that is why I mentioned this.
Well if you're happy with downloading the whole thing, that's ok with
me.

About killfile, I tend to agree. But then, should I have to add you to
my killfile, in order to avoid seeing posts where you call ppl
different kinds of names?

I should not have to do that, should I?

>These are blurred emotions... One tends to get emotional when reflecting on
>his first computer, car, hifi, girlfriend etc.

I tend to think I did not made my point clear in earlier posts. Read some of my more recent posts to get a better picture of what I am *really* after. And it's not JUST the name I'm after (that's *all* Infogrames it pitching today on boxes of game titles, isn't it?)... it's the business *behind* the name... and new Atari computers can not be made if Atari doesn't make them! The clone effort is dying because the well has run dry. People have become convinced that Atari and all it's kin are dead and so nothing anyone does to extend it's lifespan has any lasting effect. But, if you bring the company back... aye, there's the rub!

>The brandname Atari is not relevant at all in this story.

The brandname, alone, no. That's all Infogrames is pitching these days. There's no company behind the name. It's just a familiar word being slapped on game boxes to sell them. Sad, really. Atari used to mean so much more.

>Have you ever seen a Milan or Hades? or better yet have you ever worked
with
>one? I think not because otherwise you would not be writing nonsense like
>this.

I think I've seen a picture of them... doesn't look anything like an Atari to me. And, from what I detect, they're dying off pretty fast too.

>You were still sucking your thumb and playing with tin soldiers when I
>bought my first Atari.

Please tell me... how old are you? Are you 33 yrs. old yet? Well, I am! I was born in the '68, man! The first Atari computers (ooh, that classy 400!), I believe came out in the late 70's, if not later. The 2600VCS came out in '77, I think. I played that system when it was first released. You know... the one that had *SIX* switches on the front with the woodgrain trim?

Please don't come here telling me how I should feel
>and behave. I find this to be rather insulting. Especially since it's
coming
>from someone who has shown time and time again that he hasn't got a clue
>about the Atari platform anno 2001.

I owned a 1040ST when they came out in '86. I've owned a MegaST4, and a Falcon030 when it first came out. Don't think I wasn't there "when it all happened", cause I was there, buddy! IN THE THICK OF IT! All those friggin' AUTO folder patches and bug fixes and all the TOS revisions and

every Atari Faire in Glendale, Ca! I was there from beginning to end, brother! I know about the SH204 (20Mb boxy sheet metal hard drive), the SC1224 (RGB monitor), the SX212 (1200 baud external modem), and the SMM804 (I hope I have that number right; 80cps dot matrix printer) and I owned a Megafile30, too, with my MegaST4.

I can quote you every game system they made (2600VCS, 5200, 7800, Lynx (handheld), and Jaguar (64-bit game system), every ST computer they made (520ST, 1040ST, MegaST2, MegaST4, 1040STe, MegaSTe, TT030, and Falcon030), and a bunch of other stuff (like the peripherals for 'em). Oh, and let's not forget the ST Book and STacy either.

I go a long way back. And I have a lot of memories to fuel my passion. How about you?

>An Atari computer is just a collection of chips thrown together... open up
>the darn box and take a peep.

And WHO threw those chips together in just the right order to make such cool game systems and computers? Um... Nintendo? No. Sega? Naw. Sony? Nope! Coleco? Never! Commodore? Not a chance! IT...WAS....*A T A R I* !!!

Not the name. The COMPANY!

>They also sold umbrellas and PC's... if you finally wake up you'll realise
>that Atari was just an ordinary enterprise selling whatever the customer
>wanted. Their only goal was to make money, once they started loosing money
>due to a lot of reasons and shares fell they closed the books and dumped
the
>whole lot. How's that for nostalgia ?

Not bad... there wouldn't be a whole lot of "nostalgia" if Jack Tramiel had modernized his business tactics and decided that "make it and they will come" was NOT all he had to do. His mentality at Commodore stayed with him a few years too long.

>Has anyone here got an old Atari PC gathering dust somewhere? If so please
>send the case to Jared so he can fit his PC in that case and have a "real"
>Atari.

If "Atari", the name, was all I wanted, I'da bought everything with that name on it. But I didn't. The product had to suit me. And calculators and umbrellas just don't quite do that for me. And neither would a stupid PC with an Atari sticker on it, hence why I never bought one.

>Jared, I have very fond memories about my Atari 800, but if someone out
there
>was going to build a batch and revive the 8bit platform tomorrow, I
wouldn't
>be standing in line to get one.

Neither would I.

> The ST was a very innovative computer back in
>1985, sixteen years later it's time to put it to rest. I`m not implying
it's
>unusable, thousands of people still enjoy using it everyday.

Did... you... just... say... THOUSANDS?!? Dang shit! I've got a better chance at this idea than I thought! Really!

But the biggest
>majority in this newsgroup has moved on quite a bit.

I've still got that "thousands" ringing in my ears. Um, what did you say?

> Personally I don't give
>a damn about the ST anymore, it's nearly 10 years since I used one.

Me too... not about caring a (!!!) about the ST anymore... about the not having used one in nearly 10 years part.

I get the
>shivers to think I would have to crawl back again after that little black
and
>white screen....

Gee, what a shame... I used an SC1224 monitor myself...

>Oh yes, you're much to ambitious IMO. You'll need a very strong business
plan
>to convince potential investors. To generate the necessary cashflow I
suggest
>to start small. Reviving the Atari calculators productline first would be a
>good step.

Not a bad idea, actually. I was thinking along those lines. But something more along the lines of an "evolving" PDA type device for kids and teens... or adults with a tendancy for youthful devices.

>...with the money generated from that
>project you can then build your first ATARi ST2002.

If the "thousands" you perported actually even gave just $100 to the cause, that would be a great sum to invest in actually building the first new computer!

Please... spread the word. I want these thousands to help me realize this dream in a BIG way!

Jared

4687. TOS upgrade on an 1040STe

Newsgroup: comp.sys.atari.st

Hi

The TOS in the STE is hosted on two 28 pin PROMs. I have the newest v2.06
TOS on two 32 pin EPROMS which fits straight into the TOS sockets.
But it does not work. The Operating System does not boot up, but bombs
repeatedly one second into the process.
What am I missing here?

Also, can I use a 1.4 MB diskdrive straight away or do I need the Atari AJAX
chip with 16MHz clock upgrade?

I once had the program XOR (Caged Artist), presumably in a cracked version
1.53. Do anybody in this NG have this program?

Any help would be appreciated.

I don't think SCA is good. Make sure you check out any links to the manufacturers site for the spec, and ensure you get a 50-pin SCSI2 drive.

>I truly hope that someone from Infogrames is reading your crap.... he would
>beyond doubt correct you and remind you that Infogrames wrote some
brilliant
>games for Atari in the early 90's.

Did they actually write them or just publish them?

>He would probably also inform you how Infogrames started life (two talented
>French Atari programmers programming brilliant games for their favourite
>computer). Has it ever occured to you that the owners of Infogrames might
be
>just as crazy as you about the Atari label and bought it purely for
nostalgic
>reasons?

If they bought Atari based solely for nostagic reasons, they're dumber than dirt! (of course, the bible does warn, "A fool and his money are soon departed") Even I'm not THAT stupid! I don't want just the name. I want to make a product WITH the name! You'd think someone would finally get that point.

>For the record: Infogrames was one of the last softwarehouses that left the
>sinking ship. They've supported the Atari platform until the day that is
was
>costing them truckloads of money.

Good thing they've GOT truckloads of money to waste. Not exactly smart to do so, but who said anything about companies ever being smart about money or business. Just look at what happened to Atari and (more recently) Be, Inc.!

>No, for Hasbro "Atari" was only an asset. One that landed in their very
large
>portfolio of shares. And then they used the oldest trick in the book:
create
>a lot of fume and loose a lot of money (on paper), once that's accomplished
>they sell the shares to another multinational giant willing to play the
same
>game. It's simply a tax evading manouvre, every big enterprise simply needs
a
>post to write off large losses, look at what has been happening to
Commodore
>the last six years... every year the shares are bought and sold, every
owner
>writes off enormous losses. In the banking world we call this the "dance of
>death", but "creative accounting" fits the bill also. It's a perfect legal
>construction and can be repeated time and time again. Atari *started* the

>dance when the Tramiels sold the Atari shares to JTS. There are no loosers
in
>this game, everyone wins except for the taxpayer ofcourse who pays the
bill
>of this pervert system.

If Atari is just another tax write-off asset, then there may be NOTHING we can do to save Atari from those that pitch it from one juggler to another.

That's just a plain, utterly disgusting loop! Blech! Poo! Poo!

>It will take a lot of Jared Falvo's to stop the "dance of death" :-)

If there were the "thousands" (of users you mentioned earlier) like me, I'm sure the screams of discontentedness would be enough to shake the earth out of orbit! We'd all just storm the halls of Infogrames and take back what deserved better than it got.

Atari: stabbed in the back by the people who saved it and then tossed to the sharks who feast on it forever after.

Jared

Jared Falvo <luposian@azob.quik.com> skrev:

:>Jared,
:>you are a sad git! A sad, sad git! When will you leave Atari users alone?

: Hey, blame it on the Tandy 1000HX motherboard I ripped out of the (cool &
: unique!) Tandy 1000HX case that got me going again! It looks to be purely
: double-sided (not multi-layer). I got to thinking... "Hey, I bet an Atari
: 1040ST could be done on this motherboard!" And so it goes...

Didn't I tell you only a few months back to leave us alone? Are you so
thick?

:>Just like an IBM clone isn't an IBM PC. So what? Only a fraction of PC
:>users run IBM machines!

: If IBM, Intel, and Microsoft had all died way back in the XT days and no
: other hardware/OS compay picked up the torch, do you really think that "IBM
: clones" would exist today? I think not.

Possibly not. Your point being? If IBM were to be suddenly swallowed by a
black hole, few in the PC business would pay any attention. The S/390 and
AS/400 people might be in a state of shock, but the average PC user is not
running any IBM machine. What does that prove? The name isn't important!

: It's the same thing today. Why do you think that Atari "clones" (I believe
: the correct term would be "compatibles", since the off-shoots we have today
: so dis-resemble (internally and externally) the original Atari ST's, the
: only resemblance is the fact they actually run Atari ST software at all) are
: dying off? Because there is no "Atari" to "clone" from anymore! They are a
: branch cut off from the grapevine (well, actually, the other way around...
: the whole grapevine was violently ripped out of the ground and they're a
: branch from it that got snapped off in the process), slowly withering from
: lack of it's lifesource.... Atari.

If Atari were in business, there would be no clones, just as there are no
Mac clones.
The reason clones are no big success is because people are greedy, and
there are few Atari users left.
How much does a modern PC resemble an XT? Not very much, and any
resemblance is just unfortunate if you ask any computer pro.

: PC "clones" exist because Intel and "Intel clones" (AMD mainly) exist.
: You'll notice that they're no longer called IBM-compatibles or IBM clones.
: Why? Because IBM has since long been left behind as the "clone source" from
: which to duplicate.

Exactly! So why wouldn't that work with Atari clones?

: If everyone had started making "Atari ST compatibles" right after Atari was
: killed off and companies continued to write software for them and TOS/GEM
: continued to be improved upon and enhanced to this day... we wouldn't be
: having this argument. But they didn't and we are.

But they did, it's just you who are living in the past! The apps continued
to be developed, the OS continued to be developed, and clones were
developed.

:>You're living in 1986, Falvo. Shut up and leave us alone.

: No, I'm not. I am fondly remembering 1986 and desiring to restore the name
: that MEANT something back in 1986. Not the worthless, pimped "brand" it is
: today. Atari doesn't mean anything today, because it doesn't represent
: anything but what it USED to represent years ago. *Used* to... not does.

Exactly. Atari means about as much as Commodore does. IOW, absolutely
nothing. I've got a Commodore PC (A neighbour gave it to me, and it's in a
state of disassembly. I don't care much for PCs, even if they're by C=),
and there's nothing apart from the seal which sets it apart from any other
clone. I'm glad you weren't an Amiga user, since you'd be trolling Amiga
groups, claiming Commodore had to be revived in order for the Amiga to
have a future. Which is just a stupid idea. If Commodore had been a
parent, it would have lost the care of its child (Amiga) a long time ago.
And Atari weren't much better.

:>You're the one being driven by nostalgia, Falvo! You're the one who's
:>ranting on and on and on and on and on about stupid superficial features
:>like the name, the logo or the case!
:>And you have absolutely no touch with reality! If you had, you'd leave us
:>alone and shut the bloody hell up!

: If the name is *restored* to represent what it *used to* represent, then
: it's reasonable to consider that a visual reminder of that representation
: would help restore buyer interest in the renewed "brandname" as well.

Restoring a brandname is awfully complicated. It's like regaining
virginity, not so bloody likely. And it's a whole lot more difficult than
producing an entire computer and OS.
And why Atari? That name is by now so worn, that it represents all and
nothing.

:>How dare you, who are not an Atari user, who are not interested in the
:>clones, totally uninterested in any developments which have occured after
:>the STFM, come and lecture us about what being an "Atarian" entails?
:>How bloody dare you?

: How dare I? Oh, isn't it funny to be you. I *was* an Atari ST user (VERY
: die-hard at the time)... but not these days. Why? Because "Atari" is
: nothing but a pimped whore of "brandname" prostitution today! To own an
: Atari ST of any kind, original or "clone", is simply denying the fact that
: it's dead-end computer, with *no* future, because the company that started

: it is DEAD!

I'm glad that you've finally seen that. So go away and leave us alone with
our dead computers. We were doing fine without your "advice".
We are the remaining Atarians, you are one of those who contributed to
Atari's ultimate death. You have no business here, and you have absolutely
no right to tell us anything about what being an Atari entails!

: If someone wants to prove to me otherwise, go right on ahead... PROVE to me
: that Atari ST's and clones and the software that runs on them are thriving
: like they did in the 80's and early 90's. I seriously doubt anyone will
: succeed. Why? Because Atari, as a company, is DEAD! And "dead" is as dead
: as "dead" gets. And everyone is slowly coming to accept that sad fact and
: move on with their lives in a non-Atari world.

I suggest you take your stinking opinion to comp.sys.atari.advocacy in
that case and enjoy the company of Sinclair.

: I simply want to try and stop that before it is absolutely and utterly too
: late. As long as there is hope, there is a chance. As long as there is a
: chance, there is a choice. As long as there is a choice, we can TRY. As
: long as we try, we can *possibly* succeed!

You're stuck in your tracks. Nostalgy is a powerful fuel, but you can't
wear us out just by telling us over and over again. I believe the english
idiom is "don't beat a dead horse".

: But I see you think that is utterly pointless.

I certainly do. If anyone is to take the initiative in any Atari question
it is we, since we're the ones who are affected.

:>You're a sad, nostalgic git. Go read your old mags. Ignore thrity-two bit
:>processors and colour graphics. Ignore multitasking and hard drives. And
:>while you're at it, leave us alone, and stop insulting the remaining Atari
:>users.

: You continue to fail to see the point I'm trying to make. I don't want to
: sit in my (!!!) rocking chair and "remember how it was" (if I wanted to do
: that, I'd spend $500-$1,000 on a Falcon030 and jerk-off, making .MOD files,
: I *used to* compose on my Falcon030 years ago). I want to MAKE A
: DIFFERENCE! I want to restore "Atari" to a company that *made* a product
: that people *liked* and *bought* and *enjoyed*!

Your insistence on the product carrying a certain brand name is plain
stupid. It's the most superficial feature of all. I suppose all you did do
with your ST was to wank at the fukji symbol. I suppose the feature you
liked best about the Falcon was that the Atari logo was tutti-frutti
coloured.

: Before you continue ranting about what a "nostalgic git" I am, please try to
: actually see the forest for the trees, kind sir?

You're in no position to tell me what the real subject at hand is. You're the one with the real hang-up.

Hi Jared,

>The size of the community has only shrunk because the company they
>followed after was stabbed in the back!

The size of the community was already shrinking with large numbers back in 1991 due to Atari turning a blind eye to what their customers wanted. You may not like the next bit that's coming but here we go anyway:

IMO one of the reasons Atari didn't survive is because it was an US based enterprise, which sold products that were higly successfull in Europe but never really made an impact on the US market. The people in the Sunnyvale Atari HQ didn't have a clue about how different the European market was to their home market and time and time again they goofed. Anyone with common business sense would have transfered the *complete* computer divison over to Europe, preferably to Germany where truly amazing things were produced in an attempt to disguise the crap that Atari USA was trying to shove in our ***.
Way back in 1988 the European Atari users wanted a more advanced ST, two years later Atari came up with the STE. Even the biggest lunatic could have told those "brilliant designers" in Sunnyvale that the STE would not be a good enough reason for the existing userbase to upgrade their trusty ST. Atari US released the STE only to have a viable option to compete with the higly succesfull Commodore Amiga 500 which outsold Atari especially in the States by big numbers. We all know what happened: the STE wasn't good enough to attract new users and the existing Atarians didn't know why on earth they would have to get rid of their ST and buy the STE. As a direct result of this Atari had to hire extra warehouses all over the world to stock the piles of unsold STE's... check out the Atari stockprice in 1990 and wonder why it made such a big dip while stock of Commodore and Apple shoot through the roof...
In 1991 we were treated to the TT, a truly powerfull computer but Atari forgot to price it in accordance with their slogan. The TT almost did everything one could possibly want, but the problem was that most of us couldn't afford it. While some of us kept waiting for the next generation ST's to appear a lot of people turned away and bought an Apple or even a PC. In the meanwhile Atari Germany noticed the flocks of people abandoning the platform and demanded a cut down affordable TT, and that's when the MegaSTE made it's appearance. Most of us were hoping for a computer with at least a 68020 inside and the ability to display VGA in 640*400, but no, we were treated to a computer which was twice as fast as the original ST, just imagine... it took them nearly seven years to release a computer that

was twice as fast as the one released in 1985!!
The MegaSTE was ment to attract the power users, but Atari overlooked that these people already were working with a computer based harddisk. So once again we kept our trusty ST and only a very small portion of the users actually upgraded. Personally I think that the MegaSTE was one of the best computers Atari ever build, but in 1992 it was not a viable option anymore to compete against the competition. It certainly didn't attract many new users either...
As for the Falcon... I was present in Dï¿½sseldorf when it was shown for the very first time to the public. And everyone there agreed: it was the most powerfull and most innovative computer Atari ever build. But there was one tiny problem, well two actually. Problem one was that it took well over a year before most of us could actually buy one, problem two was the casing. The bright light in Sunnyvale that decided to house it in exactly the same casing as the nine years old ST is probably commited in the local asylum now, but he was partly responsible for the final stab.
I can still see it gathering dust in the local computer warehouse, there it stood: the most innovative computer of them all in its flimsy plastic casing competing with the likes of the Mac Quadra, IBM 486 and Amiga 3000, *everyone* overlooked it, thinking it was an ST and thus only capable of things which in 1994 were already considered to be ancient.
In 1995 when everyone including me was expecting a Falcon II the brilliant minds in Sunnyvale gave us the Jaguar.... We didn't ask for a bloody games machine, we wanted a computer with a 68040 and a more powerfull DSP inside that would blow away all the competition!!

Atari wasn't stabbed in the back at all, nobody had to stab them, they did a pretty good job at committing suicide themselves. They've ignored their most valuable asset: the existing customers who demanded better and more advanced computers for years. All Atari came up with in those nine years were calculators, PC's, a handheld games machine, and weird incarnations of the ST in the form of a portable computer and a very flimsy build notebook. The only succesfull sideline Atari ever had was the Portfolio which they've also neglected to upgrade in time, and let us not even mention that the Portfolio wasn't developed by the Atari R&D people but has it's origins in Britain.

You do know why Apple is still in business I presume? Apple listened to their customers and gave them what they demanded, and they still do it... Atari could have been bigger then Apple right now, if only the computer division would have been based in Europe with European bobo's in charge. Atari never succeeded to make even the slightest impact on their very own homemarket, call it whatever you like but the fact remains that the ST only was a minor hit in the States. Once Atari started loosing money and hardly generated any income they once again took a brilliant business decision: they closed down most of the European Atari branches. That *was* the final nail in the coffin....

Well Jared, this was a different vision about that precious Atari you're so nostalgic about. There's nothing to revive unless you want to revive the same crap all over again ofcourse.

Come to think of it: you would be the perfect person to revive it. Just like the old Atari buffoons you don't realise that the action takes place in Europe. You don't have a clue of what is happening here and you don't seem to give a damn about it either. All you are obsessed with is to give the Americans back a computer labeled Atari. Don't you realise that they don't want it? Ask any American what Atari stands for and he will most certainly not tell you its the ST. He'll probably have fond memories about the VCS and arcade machines, and if you're lucky you might find one that actually remembers that Atari ever build a 8bit computer. But that's it. The average American citizen doesn't have nostalgic feelings about the games you're so crazy about. Oh and for the record: those games were crappy. Atari never produced one single really succesfull game for the ST and except perhaps for 1stWord which came bundled with it, the serious software carrying the Atari label isn't worth the paper its printed on. Show me I'm wrong and give me a list of *all* those very good Atari games and serious software..... it'll be a very short list.

And here's something else to chew on: Infogrames is a European firm, you may not like it, but Atari IMO finally is where it should have been all along... in Europe. I have no idea what plans Infogrames has with the Atari assets, but I do know that in the timespan of six months they've achieved more then Atari, JTS and Hasbro put together in the last five years. I see the fuji logo increasingly more back again. Hey, they are even on TV now... one of the major French soccer teams is sponsered by Infogrames, you want a trip to nostalgia.... go to Lyon, eleven guys running over the field carrying a *very* large Fuji logo :-)
How's that for a trip down memory lane?

Cheers from Belgium
Dennis

Hi Jared,

>Does the Atari system you own have a future? Will it ever be expanded
>with today's technology? Will more software be written for it or
>upgraded/improved as technologies or needs advance?
> Um... I think... *NOT!*

You left this platform some odd years ago and obviously didn't bother about it anymore, assuming we didn't move on in the meanwhile is a common mistake made by many ex-Atarians. If you think that we're some kind of dinosaurs sticking to their antique computers and completely out of touch with what is happening in the real world then you make a capital mistake.
Yesterday you questioned our Atari loyalty, today you're questioning the reason why we're still working with outdated technology, I'm really curious to see what you'll come up with tomorrow.

>The Internet is 99% of my computer usage today. I play games every now
>and then. Any Atari unit wouldn't suffice for this need. I run in 16-bit
>color as an absolute requirement and prefer 24 or 32-bit. I have nothing
>but a DSL line out to my workshop in the backyard (it used to be a phone
>line, but after DSL, I'll *never* go back to a modem!), so I need an
>ethernet port.

Connected to my monster is a Sony 19" monitor displaying a marvellous desktop which you never heard of at 1280*1024 in 16bit. To the left of the monitor there's an Epson 1240SU scanner, at the right side I've got some room for the Epson 850 colour printer. On top of the monster are three SCSI cases containing a CD-R, CD Writer and a CDRW writer. Inside the monster there's a 9Gig SCSI drive and somewhere hidden between various bits and pieces there's also a 4.5Gig SCSI drive doing it's thing. I connect by means of a phoneline, but I've got a ethernet card here gathering dust, all it takes to use DSL or a cable connection is someone releasing a driver that can address dynamic DCHP and I'm in business. If I would have lived in a different country then I probably wouldn't have had this problem anyway.
The whole lot is powered by a multitasking OS called MagiC, this is purely based on personal taste, it would run equally well under freeMiNT (that's another little jewel which you seem to be unaware of). Inside the moster there's 128MB RAM which enables me to run anything I care to throw at it.
So it seems to me that our setup doesn't differ that much from mine, except ofcourse when we boot..... everytime I boot, the first thing I get to see is that Fuji logo you're so crazy about.
I don't have a shop nor do I run a museum, all that recent technology is actually connected to that piece of antique, and is used on a daily base.

If you think that I'm some sort of exception, then think again, you would be surprised how we moved on while you were dreaming. Some of the people here have a setup which is even more powerfull then mine, you would be surprised to find out what we achieve every single day with our outdated technology.
We do not need a PC to access internet, burn CD's, produce outstanding DTP layouts, music or even movies. I'm afraid that my gaming days are over but if I really feel the need to play some cool games, then there's always the Lynx II, another brilliant piece of outdated technology :-)

>The reason Atari clones are dying is because the founding company that
>made the originals (from which the clones sprang), is dead. And software
>manufacturers realize this, so they stop making Atari software.

At the moment someone who upgrades to a clone pays a lot of money only to find out that all he can do with it is running his existing software base faster. There is no software that addresses the power of these computers. It's the catch 22 situation. There's no software support because of the small numbers sold, and the potential customers don't buy the clones for the very same reason. Atari being dead has nothing to do with this.

Cheers from Belgium
Dennis

Hi Hallvard

Thx for your answers! I will try to look up info about this Jumper configuration right away!
Is it possible to purchase the HD/DD switcher circuit anywhere?

About X-OR: You are right in that Tim Conrady has done great work in converting various musicprogrammes into freeware. However all freeware "Caged Artist - Bob Melvin" synth editors are "Standalone" editors. The beauty of X-OR is that it can handle your complete synthsetup in much the same way as Sounddiver, which you search after yourself. You can even, fairly easy, create profiles for newer synths or midi gadgets that you may have. I have used it myself.
Of course you shouldent condone the use of cracked software - but you, of all, know how it is. It is very difficult, if not impossible, to get the official software. The original developers are long gone or have completely declined to support thir old platform. This makes it very hard to obtain and get support regarding official software. The platform is more or less given up by the foundres who participated in making it the foremost music platform.
I have been searching for Sounddiver for about 2 years before I gave up.

If we are honest, how many in this NG have not heard the name of "Mike Hunter" distributed with "Another nice HOA crack" before?

Sincerely
Peter Feddersen

>latest one? Also, it says that it's for FreeMINT - do I have to get that
>from somewhere too? Or will MultiTOS do?

I ran it with the freemint kernal. I put that in auto folder as
mintnp.prg and created a XaAES folder on my C drive. In there I put the
XaAES stuff. I modifed the config files to work, works neato on my STE.

The Kernal supplied with MultiTOS may work with XaAES but an upgrade but
be better I think. I don't know whats included with MultiTOS, AFAIK it's
the new GEM AES (4.1?) with a Mint Kernal. I think it should be possible
to use the Freemint Kernal with the MultiTOS AES as well. Try renaming
your kernal in the autofolder to stop it running and placing a new
FreeMint kernal in there. I'm not a Mint expert though so don't take my
word for it :)

I've heard serial port for midi isn't great. Anyway, I know there are
schematics on Vezzs site for a Midi expander but not that one you mention.
It may be useful, not sure.

>they work fine in a PC.

Maybe it doesn't work with NVDIs drivers for ET4000 graphics cards. Do you have any docs or disks that came with that Wittich adaptor? Perhaps there was drivers for TOS on a disk somewhere. I know there are drivers for the freeware ET4000 hardware hack, it may work with your card. I think all these adaptors are pretty much the same for ISA graphics cards.

4714. Re: Any attempt at an Atari Revival is IMPOSSIBLE!

Newsgroup: comp.sys.atari.st
Date: 2001-11-02 19:48:54 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <8LCE7.444$5C4.25514045@news.incc.net>
Source record: 40783

OMG... I never realized the entire truth of it all. You sound very "in the know" about it (as it seems it would be rather difficult to make up that material *just* to shut me up), so I'll assume you're telling the truth.

I'm not here to try and yack about reviving a brandname just for the sake of the name. I honestly loved Atari and what it made. I just wanted to hopefully bring back what Atari was and should have been before the Tramiels killed it off.

I totally agree with you on how they handled things. The "improvements" they made to the ST and beyond were far too little too late. It was like they were purposely dragging their heels just to try and do things THEIR way.

There is no doubt in my or my brother's mind that Atari screwed up big. They could have been so much better and made products that were as revolutionary as the 520ST/1040ST when they were first released. But Atari wouldn't budge. Shit!

I remember the frustration, too.

Perhaps you're right. Atari IS where it belongs. Or, at least, the closest place to it.

And, if there is any justice in the computing world, they will revive the company that died from the inside... thanks to fools that thought they knew better than their customers.

I can only hope it won't be too long before we see some innovative computers out of Atari again...

Thanks for popping my "seriously over-inflated misconception ballon". I was operating on the enthusiasm that I had and others I knew had back then. Perhaps the distain I see from people in this newsgroup is the realization I never had... Europeans knew what to do and Atari, in the US, just refused to do it. I'm goping around, trying to promote the idea that the US Atari was such a friggin' wonderful company and deserved better than it got, when it was the US-based Atari that screwed it for all of us!

Hurts like a smack on the nose with a rolled up newspaper, but... it's a necessary lesson to realize how things really were and not how they were percieved to be from a few enthusiasts in the US, like me.

Kills the whole "revive Atari in the US" thing for me... but I wouldn't mind helping de-stain the brandname, if I ever got the chance to, here in the US.

I think I'll go now. The battle is over. I give up.

But if there's any way I can help Infogrames, concerning Atari, here in the US, consider me fit and ready to take on the job.

From: progster@iname.com
Message-ID: <021120011223271908%progster@iname.com>
Source record: 40775

Hi. I'm recommissioning my old STacy for some music work, and I find that the hard drive has died.

I'd like to buy, new or used, a working hard drive that I can install in the STacy.

Advice as to what I could buy new, today, that would work is very welcome.

Offers to sell an old, working, hard drive are also welcome.

I note that the 50 pin ribbon cable in the STacy is configured with two "bumps". A couple of old drives that I had lying around had only one "notch", so I couldn't use them.

If you know the arcana of "bumps" and "notches", I appreciate a dollup of that knowledge. Thanks!

Source record: 40788
Cross-posted to: rec.games.video.classic,rec.games.video.atari,alt.atari.2600,alt.atari.2600vcs,comp.sys.atari.st

Updates this week at The Atari Times:

* Dear Fruitman, I Need A Girlfriend!
* History of Atari Horror
* Visit the other Atari Times!
* Upcoming Games From Songbird
* Featured Review: Remnant
* Revamped Adopt-a-Page
* Visit The Jaguar page

Here's a sample of History of Horror:

"Early horror games for the Atari 2600 were mostly comical due to the
low resolution graphics. Some games, like Alien, made horror promises
that were not kept. You may have expected a game
battling aliens, instead you got a sub-par Pac-Man clone. Other horror
sounding titles such as Crypts of Chaos, Nightmare, or Room of Doom
would fool gamers into think they were getting a
horror game. Alas, these games are far from being scary."

4722. Problems with Mega ST Graphic Card

Newsgroup: comp.sys.atari.st
Date: 2001-11-02 21:47:35 UTC
From: ian <ian@dotqr.com>
Message-ID: <1004737597.5034.0.nnrp-14.9e98e6ee@news.demon.co.uk>
Source record: 40789

Ive been struggling to get a graphics card working with a
Mega ST for some time now. The card is a Wittich Computer GMBH
adapter - with a ET4000 (SVGA) card. I believe this was an
early verison of the Crazy Dots adapter.

Ive tried NVDI 5 with this unit, but the various utilities that
build the .INF file required dont recognise the hardware at
all and NVDI crashes on boot.

Ive now got 3 x ET4000AX cards - and none of them work, although
they work fine in a PC.

Any ideas?

Ian.

4723. Master Tracks Pro

Newsgroup: comp.sys.atari.st
Date: 2001-11-02 22:58:49 UTC
From: Crackers <bcracknell@sympatico.ca>

Source record: 40790

Does anyone have the schematics for the Master Tracks Pro B-Serial Port Midi Expander thingie?

Also, how does this thing work on the serial port of an ST? Arn't the serial ports of the ST too slow to do MIDI?

Anyways, schematics would be great if someone knows a website where they're posted.

Yes, the SPDIF.

>I couldn't see the jacks to clearly on the picture. (SPDIF Interface)
>Does it have to be a DAT machine?
> Would a Tascam cassette deck work?

The SPDIF (FDI) has digital INS and OUTS (coaxial and optical connections). The DAT is used for _it's_ A/D and D/A converters (Analog to Digital and Digital to Analog converters respectively). It basically bypasses the built in converters in the Falcon.

The SPDIF is simply an interface box between the Falcon and the DAT. This way, the recorded [analog] signal is run through the DAT recorder, which converts it to a digital signal that is sent to the SPDIF interface box, which in turn sends it through the Falcon's DSP input, and to the hard disk. During playback the reverse is true, with the final recorded signal being output by the DAT.

A DAT is probably the easiest way to do it, though it can also be done with an outboard A/D converter box. However, unless you have a cassette recorder with digital INs/OUTs (and it's own analog to digital converters), the cassette deck is not an option.

This may sound strange, but set the fastload bit "ON" for all of your
FONTs as well (especially if you have a lot of them - which I do). I
did this in the past, in addition to setting it "ON" for everything
else, and the load time decreased by about 85%.

XaAES needs at least kernel 1.15.0
I think the one from multitos is too old.

You can download the latest kernel from http://www.freemint.de

Installing the newest kernel is always good. If you want to go back to multitos
you dont need to change the kernel. You only change the GEM line in mint.cnf.

If Phototip doesnt run with XaAES, please let me know.
It might be something I am working on already. :-)

: anyone know a way to allow sm 124 monitor to display vga or video output
: thank you

Video output? Not a chance.
VGA? First, make a cable with a D15HD in one end (connect to VGA output) and a DIN13 in the other (connect to SM124). Then you'll have to tweak your VGA computer to output 35 KHz, 70 Hz video. There are probably presets for that in most OSes. Plain, 1987 PS/2 VGa is 31 KHz, 60 Hz, so you probably won't be able to see BIOS screens and such things with a simple cable. For those purposes, you'll probably have to do some tweaking inside. It could possibly just be a matter of adjusting the right potentiometer, but it might be more difficult, too.
But it'd be a lovely sight. =)

Are you telling me the "monster" you say is so thoroughly expanded upon with... 128Mb of RAM?!? Som-be! (S.O.B., just pronounced a tad different)

This can't possibly be a TT030, can it? I more expect it to be a Medusa or Milan machine.

Here's a question. Is the "Atari" market outside of the US still thriving or is it truely dying as well and what would you say is the main cause of it?

As I've already revealed, I have been living in an overinflated misconception bubble for awhile...

If the Medusa/Milan were to have a continued upgrade path (say a PowerPC model with emulation or such), do you think people would buy it in the US or elsewhere. As well, do you think there would be a way to stimulate new software development (assuming it needs any) or is anything to do with "Atari", clone or otherwise just drying up too fast to stop?

> back... aye, there's the rub!

Clarify this even further for me: Do you actually want to get all the old
employees back and have the same people doing the work, or do you just want
to get a company going with the name "Atari" making ST-compatibles?

If it's the first one, how much luck do you think you will have with this.
And do you really want the same people who ran Atari into the ground and
pissed off a number of users and distributors back?

If it's the second, then it *is* just the name you're after because it won't
be the same exact company, and it won't be much different than what we
already have by the way of Atari-clone makers already, except with the Atari
label.

>> The brandname Atari is not relevant at all in this story.
>
> The brandname, alone, no. That's all Infogrames is pitching these days.
> There's no company behind the name. It's just a familiar word being slapped
> on game boxes to sell them. Sad, really. Atari used to mean so much more.

Here's the real rub... We already have the company(s), just not the name.
They're called Medusa and Milan instead of Atari. So if it's the company
you're after, not the name, look no further! You have your solution right
here! Yea!!!!!!

>> Have you ever seen a Milan or Hades? or better yet have you ever worked
>> with
>> one? I think not because otherwise you would not be writing nonsense like
>> this.
>
>
> I think I've seen a picture of them... doesn't look anything like an Atari
> to me. And, from what I detect, they're dying off pretty fast too.

What the heck? You judge a computer on it's exterior look and what label it
has on the outside, but not what it can do? I hated the ST case. Many did.
It was clumbsy, cables hung out every direction, you couldn't easily move it

around, it took up tons of desk space, it had a horrible-feeling keyboard, need I go on? It's the innards that made the machine great, not it's box.

Also, these clones aren't doing as well as they could because the whole force of the c.s.a.s. group combined couldn't make a dent in the market force that PC's hold. Any attempt like what you're suggesting would need a massive coordinated effort, a ton of money, a *very* unique and tempting advantage over any other machine that most people, if not everyone in the world would find too hard to resist that PC's cannot in any way offer, and a strong, long-term business plan with huge profit potential. I just don't see any of that with what we have here, let alone from you.

>> You were still sucking your thumb and playing with tin soldiers when I

> trim?

Age doesn't matter. I'm younger than you (28) and I remember exactly when the 400 and 800 came out (in 1978). I had a 2600, a 1200XL, a 1040ST, a C-Lab Falcon and an Atari Falcon (which I recased). I'm extremely familiar with the history of Atari. I grew up with them and still use and love them. But I see no merit in your crusade here.

>
>
> And WHO threw those chips together in just the right order to make such cool
> game systems and computers? Um... Nintendo? No. Sega? Naw. Sony? Nope!
> Coleco? Never! Commodore? Not a chance! IT...WAS....*A T A R I* !!!

No one's saying they didn't make good stuff. They just did it with poor business sense. And other people are doing the same thing now with better chips. *A T A R I* has nothing to do with that. It's not the name that matters, it's not the company that matters, it's the machines that matter. The platform itself. I could care less who makes them, as long as they're made.

Don't forget, Atari also made the PC1, PC2, PC4, and Portfolio. All PC-compatibles. Do you praise these as well? They all had the Atari logo and look that you highly value above functionality. But inside, they weren't any different than any other DOS box.

> Not the name. The COMPANY!

As I said... not name, not company, but machine.

Also, you're not separating the company from the name. That's what we're talking about. You don't have any real concrete arguments about why the company can't be separate from the name. You just say it can't. Give us more credible proof of your position, and you may get more respect. Otherwise, we all see it as useless ranting.

[snipped more stuff]

> Did... you... just... say... THOUSANDS?!? Dang shit! I've got a better
> chance at this idea than I thought! Really!

No, not really. We're still way too out-numbered, and you're still without a concrete plan, and credibility enough for us to want to follow. Without that, you've got nothing.

>> But the biggest
>> majority in this newsgroup has moved on quite a bit.
>
> I've still got that "thousands" ringing in my ears. Um, what did you say?

He said, many have moved on (to Hades, Milan, MagicMac, emulators, etc). They still love Atari, otherwise they'd only have TOS-less PC's and Macs. But they've moved on to faster, more up-to-date versions of the platform we love to use.

>> Personally I don't give
>> a damn about the ST anymore, it's nearly 10 years since I used one.
>
> Me too... not about caring a (!!!) about the ST anymore... about the not
> having used one in nearly 10 years part.

The ST is obsolete. It has been ever since Atari itself made more advanced machines, and certainly is compared to today's technology. No one in their right mind would switch from the PC or Mac platform to Atari if the ST from 1986 was all you had to offer.

[snipped much more]

> Not a bad idea, actually. I was thinking along those lines. But something
> more along the lines of an "evolving" PDA type device for kids and teens...
> or adults with a tendancy for youthful devices.

Ok, turning the ST into a PDA. That's at least something. However, would it look like an Atari? Probably not. Would it be as fast and advanced as some of the newer PDA's coming out? Probably not, if it's based on the ST specs, especially since it will probably take years of R&D to get to a basic design. By that time, PDA's might run circles around circa 2001 desktops.

>> ...with the money generated from that
>> project you can then build your first ATARi ST2002.
>
> If the "thousands" you perported actually even gave just $100 to the cause,
> that would be a great sum to invest in actually building the first new
> computer!

Let's say there are 5,000 people here. $100 from each gives you $500,000. That's not even enough to purchase the name from Infogrames, let alone R&D and marketting.

But ok, I'll give you $100. But only on these conditions: You must have a large-scale business plan and vision statement that I can agree with, you must secure the Atari name (since you deem it of value) from whoever owns it at the time this all comes about, you must come up with a darned good marketting scheme, able to convert the *millions upon millions* of non-Atari users to this machine you must invent, you must come up with the extra funds necessary that $100 from every Atari user just won't support, you must be able to make a tangible argument for why I should invest, and you must convince me that I will get a reasonable return on my investment. Prove to me that all these will happen, and the money is yours. Otherwise, no deal.

> Please... spread the word. I want these thousands to help me realize this
> dream in a BIG way!

Dream? How about a plan? You haven't outlined anything other than, "Hey I'm going to get the Atari name and start a business someday." Show me the details first, otherwise you have no more credibility than a freshman music major claiming to someday become the next Beethoven. He must first show signs of absolute genious or people with actual music degrees will just scoff and tell him he's not worth their time.

As I've said before, I like your enthusiasm. I once thought it'd be great to have someone buy Atari and keep it going. But that was when Atari was first going out of business. I was hoping someone would pick up the torch before the fire went out. But alas it went and no one came. There's no reason to go back and get it now that it's soggy, out of fuel, and tampled into the

ground. Put your enthusiasm behind what's going on now, and I'll back you 100%!

> "Atari", clone or otherwise just drying up too fast to stop?

I believe some of us in the U.S. would buy it if they actually sold it here. At least I would. I've heard too many horror stories of overseas purchasing to risk that much money to get one. And there needs to be a shift of some kind in our thinking. Either we commit whole-heartedly to the new features of the clones (and hope the ST users follow suit and buy the clones or otherwise risk losing some dedicated ST users), or make a clone so powerful, backward compatible, affordable, and available that ST users will not leave, but get in line to buy one (thus moving the software focus from the ST to the clones without losing the users). Unfortunately, the latter isn't as easy nor likely, and the former is too risky for us to make the attempt.

Another option: Get bold enough to make software modern enough to show off the clone's advanced features and speed, but small and backward compatible enough (or modular enough) to still be run on an ST. This is easier, but people seem slow in stepping up to the plate. There have also been claims that all the programmers of extraordinary calibur have left us (which I don't believe - I think others have come out and learned enough that they can do a good job of it, too). So we'll see what happens. If we can get a good basic set of software (in particular an Office Suite - with Internet and networking support, and presentation software like Powerpoint, and not just WP, Database, and Spreadsheet, and a browser capable of Java - whether it's usable on the current machines or not, Javascript, CSS/HTML 4.0, Flash/Shockwave, and any other new multimedia advancements that come out), then we can use these to produce interest in the new machines. We've got a decent start, actually. Good image/animation/video/audio editing (just not all in one), and a great OS. So we've got something to build on at least. But as said in a previous post, we don't have anything that'll produce much interest from the non-Atari using market.

It doesn't exist, but I think it could be a decent selling product.
Something to start the "new Atari" off with, if Atari (as a company) ever
came back.

I've got some drawings and ideas on paper. I have the shape of it sketched
out and what it does. It's got two incarnations. One for kids and teens.
And the other, for adults. Right now it has the same name for both
incarnations, but I think it would best be varied with Jr. (kids/teen
version) and Professional (adult version).

Kinda fun...

Yes I know, but it was the same code used for test, just a loop:

```
x: subq.l #1,D0
bne.s x
```

And my true test was MP3 decoding, Bogomips was just a comparison for
my MP3 results.

> The original 8086 was a 16-bit CPU with 20-bit addressing through use of
> segments. It does not belong in the same category as the 8-bit 6809.

Yes it's true if you look just the BUS, but look at the internal
registers:
8086:
AX,DX,CX,BX are in 8/16 bits
BP,SI,DI,SP are in 16 bits
6809:
D is in 16 bits <=> A,B in 8 bits something like the 8086.
X,Y,U,S,PC are in 16 bits
Excepted the MUL instruction who uses A * B => D, others instructions
works in 16 bits.

I'am sorry but for me it's the same generation, Motorola has broken this
structure when the 68000 was created, not Intel. Now about x86, it's
always prehistoric processors with now caches and GHz.

> The 8088 had the same CPU core as the 8086 but with an 8-bit external
> data bus for lower cost, much same as the Motorola 68008, which was a

Yes :-)

> even with a translating (or "dynamic recompilation") emulator, but
> PowerPCs are lagging x86 in overall performance, so in practice the x86
> may well be the fastest solution.

Humm I'am not sure, look the actual results, lot of emulators exists
under PC, if the remove displays tests (no good for CPU tests) for an
X86 clocked to 500 MHz the average speed is just 2X my 030 at 50MHz
(F030/CT2). The old 68020 emulator of Apple, and the same frequency
(a PPC at 500MHz) the average gain is 10 X like the frequency ratio
with my F030/CT2.
Some examples:
Mp3 decoding 20 X faster.
DivX decoding 10 X faster.
Compilation 6 X faster (hard disk decrease CPU tests).

For me if you want the same results than the 1st mac PPC (today 500MHz),
you need a minimum of a X86 to 2,5GHz and maybe 5GHz for mp3 decoding.
This computer not exists. For me emulation is _NOT_ the solution.
A 68060 overcloked can produce same results, for example under Falcon
the 68060 (CT60) must decode MPEG video stream and DSP 56K mp3 decoding
in the same time. With emulation you need a 10 GHz x86 CPU for this :-)

> (One exception, BTW: PPC doesn't do well at emulating 68K FP. Both 68K
> and x86 have 80-bit extended precision FP format, but PPC doesn't
> support it.)

Yes it's true, PowerFPU tests (the faster 68K FPU emulator under mac)
are not too good. But you cannot compare this to 68K FPU emulateurs
under X86 because it not exists. It's already very difficult to found an
68030 emulator :-)

Regards,

Didier.

Bonjour :)

With the lastest version of fVDI and rage.sys that you can
download at ftp://194.236.123.228 (or maybe find at the
eclipse.atari.org)...

fVDI Configurator is upgraded for some fVDI new options, such as
"scrninfo vdi" in the driver line (screen informations for VDI)
which corrects the color problems in TC16 for icons under MagiC,
or images in Papyrus...

Direct download at : http://rajah.atari.org/files/fvdiconf.zip (55Kb)
or at my homepage (just rajah.atari.org) or maybe at the EOSP.

Bye

Rajah Lone

Try STEEM or Winston, STonX if running a Unix OS.
Sorry, all ST only, currently there are no TT or Falcon emulators available
for any platform.

http://steem.atari.org/
http://winston.atari.org/ (huh - don't remember exactly)

>there was drivers for TOS on a disk somewhere.

The Wittich graphic card is a very early incarnation of what later became
known as the NOVA card, it was marketed as the Imagine card, now we've got
that cleared up, it's only a matter of time before someone here using a
similar NOVA with ET4000 card helps you out...
I'm almost certain that you need an additional driver other then the ones
supplied with NVDI.

Cheers from Belgium

>
> I hope that ALL understand my, because my English is still bad ;)

Hi

I guess u dont do GEM program, but some fullscreen app, maybe game? In that case u need to get and save physical and logical screen bases on begining of your program and move actual screen adress to another location untill u exit application.
If u dont do that, you will draw on same screen as system did before and u loose draw content (usualy u need to redraw screen manualy after u quit)

You can save actual physical and logical screen adresses like this:

old_physbase%=xbios(2)
old_log_base%=xbios(3)

Now, when you have that saved (for restoring later), you need to set new screen adressess:

~xbios(5,L:new_physbase%,L:new_logbase%,-1)

new_physbase% and new_logbase% are adresses where u want to move screen for your application. It is smart that u reserve those before. U can use DIM and VARPTR for that etc.. For quick test, new_physbase% and new_logbase% can be just old_physbase% and old_logbase% + 34000 (screen size on ST)
All text and drawing will be now done there. U can now do whatwer u do in your apps. When u quit your program, u must set screen to old adresses!! Again use xbios 5 (setscreen):

~xbios(5,L:old_physbase%,L:old_logbase,-1)

That shold do the trick.. Also that way u will prevent that apps "under" yours will pop out...

Janez

4746. Any Prospero users here?

I bought Scooter which is nice. I bought it from Peter West IIRC which
can converted to English with a nice fat English manual. It runs on any
Atari and clone and cost me around ï¿½50 or 150DEM. It is also available in
its native language, German. A demo can be got from chapelie AFAIK. It
works very nicely, I sometimes use it in black and white or 4 colours as I
can squeeze a higher resolution out of the Falcon this way. It also works
OK under multitasking.

Its not that simple, you also need some logic to switch clock rates and step
rates.

> I once had the program XOR (Caged Artist), presumably in a cracked version

I haven't been here for a long time, but still have a 4Mb STF... so
was curious to know which product/company using Atari name and logo as
sponsor to the French football club Lyon as seen in Champions League
this season??

Cheers if you know.

You mean the menu bar? I think with the correct
x, y, width and height in FORM_DIAL, you'll have
the whole screen.

One of the GEM "rules" for clean apps is not to write
in the menu bar.

That is true.

form_dial(3, 0,0,0,0, 0,0,screenwidth,screenheight)

will send redraw messages to every GEM app that has windows open
(including GEM itself).

The effect will be the same as remembering the whole screen.
That is, if you were the only untidy application present. ;-)

>on my old Atari, I'm baffled why someone who pays by the second
>does not...

I can tell you why: Because generally it costs more that way *and*
wastes considerable time! I used to download headers only, but
found that a) it took ages to look through and select them, b) I
probably wanted to download most of them anyway as the headings
weren't clear enough to make a decision on and c) it then needed a
separate blink to get the posts - so at least another phonecall or
wait until the next blink, which may not be till a day or so
later. So I decided that a full download was preferable.

On the matter that started all this, strictly speaking Steve is
right as commercial ads are banned in private newsgroups by the
RFCs, I think. Personally I don't mind seeing Ben's adds now and
then, but not every week (at one time he used to post it twice!)
and not at such length. I think it would be better if he posted
either a summary, or just a link to a web page with perhaps a few
highlights of what's new. Just my 2 cents worth!

Regards, /Peter/

>with... 128Mb of RAM?!? Som-be! (S.O.B., just pronounced a tad different)
>
>This can't possibly be a TT030, can it?

Why can't it possibly be a TT030?
All that's needed is a Magnum TT memory board (plug and play) and a couple of EDO SIMM's. The Magnum board can be expanded up to 256Mb.
And that's only the start: To add a graphic card all one needs to do is shove it in the VME port. You want ethernet? shove a Riebl card in the VME port and you're in business. Hard disks, CD-R, CD writers, CD-RW writers, tapestreamer, removables, card reader, scanner etc... are no problem at all as long as these have a SCSI connection and there is a suitable driver available... if you want to connect that lot and run out of usable SCSI ID's then there's still the DMA port which allow another seven units to be connected with a little help from the LINK '97.
And there's more to come... the 4 serial ports can be used to attach a modem, a serial mouse, graphic tablet and a serial printer. Assuming someone has also connected a Atari laser printer to the DMA port he's able to use three printers at once (there are several apps which can do this). I assume you know what can be attached to the MIDI ports and Romport?
I nearly forgot to mention the STarTrack audio card!! this card beats the crap out of a Falcon, and since it has a VME port can also be used in the MegaSTE and that dreadfull Hades <grin>.

I admit that the example is a little "over the top", but it really wouldn't surprise me one little bit to hear that somewhere out there a dedicated Atarian is working with a more or less similar setup. Remove a couple of the SCSI units and the same can be done on a MegaSTE, expanding the Falcon is a little more difficult since it has no VME port, but you should know by know that Atarians are inventive people :-)

I realise that the question if "the monster" could possibly be a TT030 isn't answered yet but I hope you realise now that it's not really important. You would truly be amazed to find out what kind of setups people are using here. Be it a MegaSTE, TT030, Falcon, Milan or Hades there's one thing we all got in common, when we boot the system, the very first thing we all see is the Fuji logo appearing on the screen, brightening up the day.

Cheers from Belgium
Dennis

Does that mean that the highest version of TOS that any emulator will run is... 2.06? I was hoping to get an emulator to run 4.04, which is what my Falcon has. I tried using DISK_IMG.PRG to get the image from my Falcon, but STEem doesn't recognize it. Dang! Is Falcon emulation a problem because of hardware, TOS, or both?

Thanks,

Don't know if this is old news (poor newsgroups feed) but anyway Okami
3.0 is now available from Jos den Beckers homepage at:

http://www.xs4all.nl/~josdb/okami.html

The version jump from 2 to 3 indicates a major rewrite of the program...

And yes, it is still an Atari program :-)

Hm, Jos den Becker earlier said the Okami project would not be worked on
any more. This looks like a kind of "inverted vapour ware" to me. Not too
common in the Atari world :-)

Falcon hardware is much more complex and therfore it is much harder to write
Falcon emulator.

Is this a SCSI drive or an IDE drive? A SCSI drive is what most ST's
use and then you need a host adapter like the Link II to connect it.
That is what I use on my STe. Great product...

This has been an interesting discussion, but hope of any Atari
production revival is fantasy. There is some possibility that existing
Atari hardware may become collectable and increase in value. Better get
it while you can.

I still use my TT, It's a great computer, but why upgrade it when there
is so little new software. All the software I have works just fine in
6mb of memory.

How much money is a Magnum card? A graphics card? A Riebl card? Where
do you find this stuff? Not in the USA. The dealers are GONE from here.

You can buy a complete 1ghz PC for less than the current price of all
this upgrade stuff for a TT. For internet use, you can buy an old Mac or
PC for less than the price of a Magnum card alone for the TT. Since
Atari programs are small, any Atari software found on the internet can
be downloaded to a Mac or PC and transferred to the Atari via a floppy.

A 1040 ST, along with a color monitor can be found for less than $50,
and works for most of the great Atari games still not available on any
other platform. Many Atari games won't run on a TT, and those that will
usually won't run on the TTM monitor. I had a Falcon, and a lot of ST
programs wouldn't run on it either. If you want to run ALL Atari
programs, you're going to need three Atari computers.

I have not found any Atari emulator for my G3 Mac that works as well as
a real Atari. On NoSTalgia, the mouse acts like it is connected to the
cursor with a rubber band. What's the deal with that? Is Atari
emulation any better on a PC? I kinda doubt it.

>you dont need to change the kernel. You only change the GEM line in mint.cnf.

Out of interest, what would the GEM line be for MultiTOS? I must
admit I'm a bit confused. I thought MINTNP.PRG *was* MultiTOS, now
I've replaced it with MINTNP.PRG from FreeMint, so how can I keep
FreeMint *And* run MultiTOS?

At first glance, PhotoTip is not happy with XaAES - it says "Please
install Auto folder program WDIALOG", but I assure you it is there!

May be something to do with the Auto folder order, but I've spent all
day configuring XaAES, Mint, rebooting, disabling things, rebooting,
renabling things, rebooting etc! So I've had enough for tonight...

> (F030/CT2). The old 68020 emulator of Apple, and the same frequency
> (a PPC at 500MHz) the average gain is 10 X like the frequency ratio
> with my F030/CT2.

Apple's 68k emulation uses dynamic recompilation, also called JIT, which is usually 5x or even 10x faster than conventional emulators. There is not any PC emulator which uses DR/JIT, so please stop to compare uncomparable things.

> For me if you want the same results than the 1st mac PPC (today 500MHz),
> you need a minimum of a X86 to 2,5GHz and maybe 5GHz for mp3 decoding.

Not true. I made some speed tests of Aranym (http://aranym.atari.org) on my machine (Athlon 750@915Mhz with plain SDRAM) and it seems to be fast enough for mp3 decoding (just watched at % numbers, sound is not implemetnet yet). Aranym uses modified 68040+FPU core from BasiliskII, JIT is not implemented yet. Since it is totally unoptimized alpha version written fully in "C", the speed results are very impresive. I tested mp3 encoding (Aniplayer+Lame_060.slb under Mint) and it takes 189 secs for encode of 27 secs of music. I don't know how fast is it related to real 68060 based machine, but I think it's probably same fast or even faster. Anyway, It's 30 times faster than my Falcon with FPU.

> For me emulation is _NOT_ the solution.

Well, the 68k family of processors is dead. The fastest one, the 68060, is still slow for many tasks. Thinking about DVD, DivX or at least VCD ? Dream on. If you want a faster CPU, then you must move to another line of CPUs and it means emulation.

Of course the 68k emulation is not the goal, but only the first step. Then we can use native power of the new CPU. We can start with native compiled .SLB libraries for MPEG1/2, DivX, Lame enc, etc. and finish with fully native TOS compatible OS which has built-in 68k emulation and is capable to run old apps from orignal Atari simultaneously with newly compiled native ones.

regards,

Ctirad

P.S. Sorry to all native english people, my grammar is probably very bad. I hope you uderstand ;)

4779. Problem with Uwe Seimets HD Driver v7.7 for TOS

Hi

I do not understand the following
I have an Atari STe with a SCSI link running a 2GB Seagate ST32430N Hardisk
using Uwe Seimets HDdriver v7.7.

No matter what I do the HDdriver utility will only format the Harddisk up to
one gigabyte. Am I missing something here?

Yes I know. Lots of info, but not very clear (imo).

Example: this is part of an .img file I like to decode and show on the
screen. According to the header compressed image data starts here
(image= 639 * 399, 8 planes and saved with graftool):

```
ff 04 52 52 52 52 52 52
52 50 52 52 52 52 52 50
80 02 0f ff a0 80 04 ff
f8 7f ff a8 80 02 ff e0
50 00 00 ff 04 52 52 52
52 52 50 80 02 08 00 20
80 04 00 08 40 00 28 80
02 00 20 50 80 08 00 02
```

etc...(btw. saved with vision it looks different)

I simply have no clue what happens here.
The actual images starts with 4 black scan lines.
Can someone please explain what happens here?

Guido

Apart from the DSP,
isnt PC floating point IEEE754 (I dont know the exact number by head, I mean of course the same standard as the 68882)?
In that case just executing the linef opcodes Intel native would make the emulator many, many times faster than a real 68882.

Well, that is what I expected when I bought Tos2Win. Big disappointment. :-(

First off you should not need to format the drive at all, but only
partition it. I suspect that you haven't partitioned it, and/or
are using a normal filesystem. TOS can't access partitions larger
than 1 GB. MagiC or MiNT with FAT32 partitions have almost no limit.

Regards, /Peter/

You sad muppet. How many dealers are left? How many of the dealers can
afford
to waste money on main stream advertising that at the end of the day the
cost is
passed onto the customer. What's your next argument ? Toooooo expensive?

If the platform represented cutting edge technology and commanded a hugh
audience then
what you say would be valid. However this is not the case and the remaining
users should
welcome anyone willing to participate in the group.

> Do you really want a filter list that's a mile long? :-/

Get a life muppet. A mile long?
Just how popular do you think the platform is. What year do you live in?
